It is claimed that the roofs of these furnaces are of extremely simple design, standard shapes of silica brick being utilized except where the electrodes enter. The charging door shown in the accompanying illustration is operated by a hydraulic cylinder of the double acting type, which enables the operator to stop the door at any desired point. The furnaces were built and installed by the Greene Electric Furnace Co., Seattle.

New Switch Operated by Clapper Type Magnet

A new oil-immersed magnetic contactor, operated by a clapper type magnet, has been developed by the Cutler-Hammer Mfg. Co., Milwaukee. This contactor, which is shown in the accompanying illustration, has a capacity of 100 amperes at 2200 volts, and is designed for use as a main line switch for an automatic 2200-volt motor starter, or for the remote control of any 2200-volt light or power circuit. It is built with three poles, unless used with an auto-transformer starter when five poles are provided.

The frame of the contactor, which is of heavy sheet iron, is arranged for wall or switchboard mounting, and carries two cast iron supports with two insulated shafts carrying the contacts. Leads from the contacts connect with suitable terminals extending through high tension insulators mounted on the top of the frame. The armature is pivoted to the frame, and is connected by a rod to an arm of the shaft carrying the moving contacts. The attraction of the armature against the face of the magnet rotates the shaft and closes the switch, which is normally held open by the weight of the moving parts.

A head of oil is maintained over the contacts by providing a sheet metal tank of ample capacity, and as the contacts are situated above the operating shaft, they are away from any sediment which might accumulate in the bottom of the tank. The arc is broken at the contacts in a horizontal direction and therefore rises to the point of rupture without burning other parts.

OIL TANK REMOVED FROM NEW SWITCH SHOWING CONTACTS AND ARCING SHIELDS

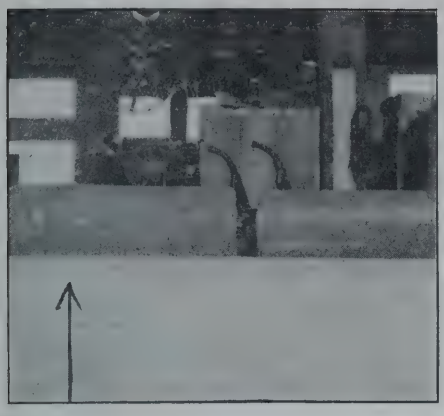

FIG. 1—ARROW SHOWS LOCATION OF WELD IN PIPE FRACTURED BY TEST

Test Tensile Strength of Welded Pipe

Tests recently were made to determine the tensile strength of two sections of 2-inch extra heavy steel pipe which were thermit welded for the Carnegie Steel Co. at Clairton, Pa. After the pipe was welded, the welded sections were pulled in a tensile stength test machine. The first pipe broke 4 inches from the weld at 113,800 pounds and the second pipe failed 4⅝ inches from the weld at 124,100 pounds. In Fig. 1, the arrow indicates the location of the weld, while Fig. 2 shows the cross section of the pipe at the break.

Christen Large Crane at League Island

The largest crane in the world was formally christened "League Island" at the Philadelphia navy yard on Saturday, Dec. 6. The simple but unusual ceremony was performed by Miss Bertha Kaltenbach, Cleveland, a daughter of one of the officials of the McMyler-Interstate Co., Bedford, O., which built the crane for the government. As the bottle of champagne broke upon the forward block of the four lifts, the big machine hoisted four loads and swung them completely around the end of the new fitting-out dock. Demonstrating its capacity, the new crane carried a yard-locomotive on the extended arm, a second locomotive as a counterweight under the machine house, and two compound loads on the arm weighing 416,000 pounds each.

The big machine, designed to hasten the equipment of major vessels of the navy, is designed to lift 350 gross or 392 net tons. Its cost was approximately $1,000,000, the contract price for the crane without the foundation being reputed to be $865,000. The whole was assembled and constructed in the yard upon the fitting-out dock which it equips. In building the crane, a specially constructed derrick with a 265 foot boom was used.

Unlike the smaller capacity hammerhead, the revolving portion of this crane is supported by a structural steel octagonal pillar. This pillar tapers gradually from the bottom to the top and forms a support for the roller bearing which carries all of the rotating parts of the crane. The combined load is, therefore, carried upon a space the diameter of which is approximately only 4½ feet, and upon 2½-inch roller bearings. The revolving portion of the crane consists of a horizontal truss, the front portion of which supports the trackways carrying the main and auxiliary trolleys. The rear portion of the truss supports the machinery as well as the counterweight. The truss maintains its horizontal position by means of a structural steel frame or apron which encircles the pillar and extends down to a point near the portal. Steel rollers are mounted in a flexible pin-connected band at the bottom of the apron and come in contact with an annular roller path on the pillar.

The crane is equipped with two distinct main hoist units, each having a separate hoisting and trolley racking mechanism. Each main hoist has a maximum capacity of 175 gross tons and

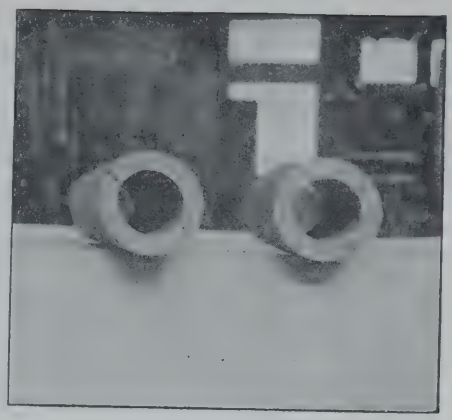

FIG. 2—THE CROSS SECTION OF THE FRACTURE PRESENTS A SMOOTH SURFACE

may be operated separately. To develop the maximum capacity of 350 gross tons, the two main hoists are operated jointly as a single unit through a mechanical and electrical coupling device.

The crane is operated entirely by electricity and it is reputed to be simply controlled, being designed to be operated by two men if necessary. The machinery house on the rear cantilever is fitted with a crane runway of 42-foot centers. This crane runway supports a 35-ton electrically operated overhead traveling crane for handling the operating mechanism of the shipbuilding crane

© by Ledger Photo Service

LARGEST CRANE IN THE WORLD—IT LIFTS 350 GROSS TONS

when necessary. The crane runway extends over the end of the rear cantilever, which enables the overhead traveling crane to raise or lower machinery parts.

Each main hoist capable of lifting 175 gross tons, has a radius of 115 feet; acting together they can lift 350 gross tons with the same radius. Two 8-part lines are used on each main hoist, 32-part line being used to make the maximum lift of 350 gross tons. The auxiliary hoist, the lifting capacity of which is 50 gross tons, has a radius of 190 feet. The load is handled on two 4-part lines. The minimum operating radius of each hoist is 41 feet. Both main hoists, operating singly or jointly, have a speed of 2.5 feet per minute carrying the maximum load or a speed of 10 feet per minute with no load. The auxiliary hoist is capable of a speed of 12 feet per minute with the maximum load or 30 feet per minute with no load.

The sluing speed of the crane is one revolution in 12 minutes. The trolley racking speed of both main hoists, singly or jointly, is 12 feet per minute with the maximum load or 100 feet per minute with no load. The trolley racking speed of the auxiliary hoist is 100 feet per minute with the maximum load or 150 feet per minute with no load.

The navy department let the contract for this record crane in 1918 and a complete engineering description was published in the April 18, 1918, issue of THE IRON TRADE REVIEW. Those present at the christening ceremony comprised officials and friends of the contracting company and naval officers stationed at the League Island yard. The acceptance of the crane by the government will await the reports of the governmental representatives who will now make rigid tests.

Ask For Profit Sharing Data For Survey

The National Civic Federation, Metropolitan Tower, New York, is circulating form letters to manufacturers and employers, in an effort to assemble data concerning profit sharing plans, where existing, for a revised edition of the report, "Profit Sharing by American Employers," which was published by the federation in 1916.

Employers of labor are asked to advise the committee in charge of this work, which is headed by George W. Perkins, concerning the following points: The date of installation of your profit-sharing plan; and, if not in force, when discontinued and why. What is your average number of employes and how many participate in the plan? What is the feeling toward the plan by those for whose benefit it was intended% Has your profit-sharing plan been the means of modifying the tendency toward labor troubles? Is it limited to heads of departments or does it include the rank and file? Is it regarded unqualifiedly as a success? If not, where has it failed to accomplish your aim?

Zinc Smelter Planned

The Burma Corp., Ltd., will construct a zinc smelter at Janshedpur, India, about one mile from the plant of the Tata Iron & Steel Co. The smelter will have a capacity to use about 25,000 tons of zinc concentrates a year, produced by the Burma Mines, Ltd., a subsidiary of the Burma Corp., Ltd., and expects to have an output of about 10,000 tons of zinc. The company also will produce sulphuric acid. While the Tata Iron & Steel Co. will be the largest customer of the new smelter, the sale of zinc will not be confined to this customer. Lawrence Addicks, consulting engineer, 6 Church street, New York, is about to close on about 3500 tons of structural steel for the proposed plant.

Makes Electric Ingots

Two Webb electric furnaces which have been in operation for several years at the plant of the Old Dominion Iron & Steel Corp., Richmond, Va., recently have been adapted successfully to the production of 2-inch ingots, weighing 30 pounds each, which are rolled directly into horseshoes, thus saving the expense of breaking down large ingots into billets of small section. By means of a novel method involving the use of a mold, a 3-ton heat is cast into these small ingots in 7 minutes and the horseshoes produced are in every way equal in quality to those produced from the broken down billets before the new practice was adopted. The furnaces are basic-lined and produce a heat of carbon steel of ordinary grades in two hours from start to tap. For alloy steels, a longer time is required.

Reline Furnace Speedily

What is claimed to be a time record for relining a stack of its size recently was made at the furnace of the Bessie Furnace Co., New Straitsville, O., owned and operated by the Allen S. Davidson Co., Pittsburgh. This stack was blown out Saturday afternoon, Nov. 8, and was relighted early Sunday morning, Nov. 23. It was idle exactly 14 days and 11 hours. In that time, the old lining was taken out, a new one laid in and sufficient time was allowed for the new lining to dry out. Bricklayers worked five days and five nights and 11 hours.

Another feature of the operation was that only the first heat poured Sunday morning, Nov. 23, was off in analysis. Usually, it takes several casts before the proper analysis is had from a freshly lined stack. This furnace has a rated daily pig iron capacity of 175 tons, but running on bessemer ferrosilicon or silvery iron, of course, does not produce anywhere nearly that tonnage.

To Apply Powdered Coal

In order to increase production and efficiency, to meet the heavy demand for sheets, the Inland Steel Co. will proceed at once with the installation of a complete powdered coal system for firing 40 furnaces in its plant at Indiana Harbor. Greater output per ton of fuel used and reduced labor cost are expected to offset the present labor shortage and the high cost of fuel. For the initial installation, powdered coal will be applied to 16 sheet furnaces, 16 pair furnaces, three continuous plate mill furnaces, two continuous bar mill furnaces and three slab heating furnaces. The contract for this work, which has been awarded the Quigley Furnace Specialties Co., 26 Cortland street, New York, calls for the engineering work and installation of a complete milling plant with capacity of 20 tons per hour, with provision for extensions, compressed air distribution system for transporting pulverized fuel to furnace bins through small diameter standard wrought pipes, and the necessary fuel feed controllers, air supply system and burners. Arrangements are also being made for an extension to the boiler plant and other departments.

The last monthly meeting of the year for the New England Foundrymen's association was held Dec. 10, at the Exchange club, Boston. Frank B. Gilbreth, consulting engineer of Providence, R. I., read a paper on "What Industry Must Do to Allay Unrest and How It Must Be Done." The paper duplicated somewhat a talk given before the American Foundrymen's association in Philadelphia.

Coal Regulations Are Relaxed

Fuel Administrator Garfield Ignored by President in Settlement of Strike—Question as to Whether Secret Promises Were Made to Miners—Coke Supplies Are Not to be Further Curtailed

WASHINGTON, Dec. 16.—Last week was one of contradictions to the steel manufacturer who is dependent on coal and coke for the operation of his plants. In the early part of the week he, having already suffered considerably from the shortage of coal, had his coke supply curtailed 25 per cent. This was followed immediately by the report of another proposed cut of 25 per cent. Before this report could be affirmed or denied, the miners in session at Indianapolis voted to end the strike, and it was then stated here that the government would not make any further orders requiring less production of coke. Assurance of continued coke production on a 75 per cent operating basis came, of course, with the assurance of better fuel supplies resulting from settlement of the strike. Relaxation of priority rules was afforded by the order of the fuel administration last Saturday, providing that emergency needs of industries will be met when the coal supply in the respective regions makes it possible, although application for coal to the railroads which ordinarily supply coal for such industries.

The week also brought out the re-establishment of the government's war-time coke prices which action put the coke industry on a par with the bituminous coal industry, so far as federal regulation is concerned. This price matter, however, like that pertaining to coal, affected only spot sales of coke, as contracts were in no way infringed except, perhaps, as to quantity of deliveries. The shortage of coal created a larger demand for coke and spot quotations were soaring when Fuel Administrator Garfield stepped in and fixed the price, turning over to Director General Hines, as he did in coal, the control over the distribution of coke.

Another and equally important development, so far as the public is concerned, was the resignation of Dr. Garfield. The fuel administrator resigned on the ground that the President's solution of the coal strike problem was a surrender to labor and not fair to the public, although it, like any other settlement, naturally would result in increasing the coal output and at the same time lessen the suffering from lack of fuel. The President absolutely ignored the fuel administrator when he arranged through Attorney General Palmer to settle with the mine workers.

Dr. Garfield, except for the President, was absolute in administering the Lever act so far as fuel is concerned. His plan was to have a consultative body, somewhat like the railroad wage commission, which would review the miners' complaints, the operators' offers, determine the facts in the case and recommend wage adjustments. The administrator would be free to accept or reject the recommendation, of course, and even though he had declared unequivocally against increasing the price to the public it is believed he would have been fair with the miners and given them more than 14 per cent had the facts warranted.

The President's plan, however, as viewed here generally, would ignore the fuel administrator as the President himself did in getting the miners to accept it. At that, the President's plan is practically nothing more than the Garfield plan, except for the transfer of authority, and it won the miners as Dr. Garfield had been unable to do.

Dr. Garfield failed in this because Secretary Wilson of the labor department, who has certain mediatory powers, and proposed a higher increase as settlement of the wage controversy. The miners explained that they didn't know whether Garfield or Wilson was speaking for the government.

The President's action, however, could not be construed as other than the government's. There are many here who believe the truth in regard to the coal settlement has not been told. It is suggested that certain promises of what the proposed commission might do were so convincing as to cause the jubilation which everywhere is said to have characterized the activities of the miners following their conference with Mr. Palmer and Secretary Tumulty here, Dec. 6.

Withdrawal of the court proceedings at Indianapolis, whether actual or only promised, at the time of the conference, is believed not to have influenced the miners. They appeared to be absolutely calloused to government and court actions and while pretending to obey the law actually did not obey it. The original court order demanding canceling of the strike call was mailed out, but not on official stationery. The canceling order of last Wednesday was telegraphed and, of course, not on official stationery. This alone has served to convince many of the tactics of the miners.

Ship Board Uses 2,500,000 Tons of Steel

WASHINGTON, Dec. 16.—The United States shipping board at the end of the current calendar year will have consumed approximately 2,500,000 tons of steel in the construction of ships. The deadweight tonnage that will have been turned out will exceed the original estimate of 6,000,000 deadweight tons. This became clear with the announcement last Friday by John Barton Payne, chairman of the board, that deliveries up to Dec. 1 totaled 5,818,500 tons. These deliveries included 4,472,000 tons in steel ships, 1,298,000 in wood ships, 42,000 in composite ships and 6500 in concrete construction.

The active construction program of Dec. 2 showed 2314 vessels of which 2240 had keels laid with a tonnage of 12,926,486 deadweight. There were 1910 ships of that number launched, with a deadweight tonnage of 10,494,047, of which 1674 vessels had actually been delivered to the shipping board, the dead-

weight tonnage delivered up to Dec. 2 being 9,189,236.

At the same time, Chairman Payne made public an outline of the American passenger and freight service to Europe, South America, Africa and the Orient, which must be maintained by the government for the next 12 months to establish trade routes for the future American merchant marine. The outline was submitted to the board by John H. Rosseter, who resigned as director of operations on Dec. 1.

Mr. Rosseter advocates the placing of 29 former German passenger vessels and 26 passenger ships, newly constructed by the board, in permanent passenger and mail routes to the most important trading sections of the world. He is opposed to any attempt on the part of the war department to hold the former German ships for what he terms "wasteful operation as permanent transports.

"Instead of the army," says Mr. Rosseter, "maintaining a special transport service or services at a heavy cost its traffic requirements in the way of movement of troops, as well as cargo, can be taken care of by regular lines, at least in all the important routes."

May Expect Delivery in Good Time

It is shown by the reports that the shipping board can expect delivery of three of the new passenger vessels of the so-called 535-foot class next June, and the remainder of the class during the next six months at the rate of two a month. Of the 502-foot class, first deliveries are expected about July, and then at the rate of about one a month over the last half year.

Continuation of government construction of passenger vessels is regarded as being impracticable by Mr. Rosseter but as a building program for the coming year he suggests 70 cargo liners and also a limited number of small passenger boats. Mr. Rosseter says:

"As to the cargo liners, I would confirm my previous recommendations that we construct: Twenty, 15,000 tons deadweight, 14.13 knots; 20, 12,000 tons deadweight, 14.13 knots; 20, 10,000 tons deadweight, 13.12 knots, and 10, 11,000 tons deadweight, 13.11 knots.

"As to the small passenger trains, I would suggest adding to the building program 10 of about 5000 tons cargo capacity, with accommodations for 50 first-class passengers, 100 steerage and arrangements to take care of upwards of 100 deck passengers in 'port-to-port' traffic."

Miners Expect Greater Advance Later

WASHINGTON, Dec. 16.—Members of the senate subcommittee on interstate commerce plainly showed their sympathy with the attitude taken by former Fuel Administrator Harry A. Garfield during the hearing they held Saturday when they questioned him about his proposal for settlement of the coal strike which was refused by the union miners. He told of his subsequent resignation, which, as he explained, was due to his inability to accept the underlying principles laid down by the President in the latter's plan of settlement, which was accepted by the miners. The terms of the President, considered by some members of the committee to mean a yielding to the miners, were declared by Dr. Garfield to be "fundamentally wrong as a matter of government." Dr. Garfield said his objection to the plan of the President "goes to the point that the commission which I understand will be set up to decide wages and prices will be composed of three members, one to be a miner, another to be a coal operator, and the third to represent the general public. Under it, the public, which is the chief party at interest, would always be in the minority." He expressed the opinion in reply to a question by Senator Townsend, that the miners and operators may have a common interest in increasing wages and costs and passing the increase on to the public in prices, although he stated he was not charging that this would be necessary.

It is known, however, that members of the committee believe this will be the inevitable outcome unless something is done to prevent it. Some who are strongly opposed in principle to the idea of government control or operation of the mines have become so displeased with the President's substitute plan that they have indicated the government should take action with that end in view. It is evident, though, that even in the improbability of legislation being passed for this purpose it would be defeated through the veto power of the President. As the case stands, it is thought that the public will have to bear the burden of the increase and it is no secret that the union miners think they will be allowed a wage advance of 31.9 per cent by the commission, the increase that was suggested by Secretary of Labor Wilson, but which Dr. Garfield refused to agree to, proposing instead a raise of 14 per cent.

In the event an increase of 31.9 per cent is granted senators say they look for the operators to pass the entire added cost to the public and not endeavor merely to make an increase of the difference between 31.9 per cent and 14 per cent, the latter being the amount which Dr. Garfield said the operators could afford to absorb. For that matter, now that the Presidential commission will have the power to determine the advance instead of being only an advisory body, as was suggested by Dr. Garfield, it is the common belief that any increase that may be allowed will be passed to the consumers. Some operators are said to have already refused to open their mines under the proposal that they absorb the suggested 14 per cent increase. Under the Lever act the government has authority to open and operate such mines.

The manner in which the President's plan was arrived at may be inquired into closely by the committee through an examination of Attorney General Palmer and other government officials, as well as of operators and miners. Senator Frelinghuysen, chairman of the subcommittee, has intimated that the whole plan of the President, adopted without consulting Dr. Garfield, will be gone into fully.

Dr. Garfield denoted that he had determined to stand by his position, despite the refusal of the union miners to accept his terms and said he had gone home "thinking the matter would be fought out." Thereupon the President summarily took the question out of his hands and arranged a plan of settlement after a secret meeting between the attorney general and acting President Lewis and Scretary Greene of the miner's union.

Sells Tools at Profit

Washington, Dec. 16.—The director of sales office in the war department for more than a month has been selling machine tools on the basis of negotiation. The former plan of selling them at fixed prices based on their service value has been superseded, it was stated at the office, but no explanation was given. It was suggested that the government has as

much right to make a profit on machine tools as any one else. This policy is not entirely subscribed to by officials in the bureau, and it was pointed out that sales have not been any more satisfactory under this plan than under the former. The fixed price plan was worked out after months of study and it was, at that time, the consensus of opinion among machine tool builders, war department officers and economists that the plan was the best for all practical uses.

Immigration Problems Are Reviewed by Wilson

Washington, Dec. 16.—Future immigration will depend primarily on the ability of European countries to initiate an era of peace and profitable employment for those who have survived the war and those who hitherto have been occupied in its pursuit, Secretary Wilson declares in his annual report. Considering Europe as a whole, he said, there are some factors growing out of the war which may retard immigration and many which may promote it. He makes no recommendations covering the subject.

The report has nothing to say of the steel strike. It is true the report is intended to cover only the fiscal year ending June 30, but as the international labor conference held here beginning Oct. 29, 1919, and the industrial conference held here beginning Oct. 6, 1919, are discussed, it is not explained why there is no comment on the steel or coal strikes. These may be discussed in the report a year hence.

Antidumping Bill Passed by the House

Washington, Dec. 16.—Passage last week by the house of the Fordney antidumping bill has placed it, like the antidumping measure of Senator Smoot, before the senate committee on finance, but it is unlikely that either bill will be given early consideration by that committee. Even if antidumping legislation should be passed by this congress, it is believed the President, because of unsettled commercial conditions, would veto it. This opinon appears to be emphasized by reason of the President's comments on the tariff situation in his recent message.

The Fordney bill, which passed without a record vote, is intended to protect American manufacturers from the flooding of American markets with foreign products sold at lower prices in the United States than in the country of manufacture. It authorizes the secretary of the treasury to send agents to inspect the books and plants of the manufacturers and to study prices of merchandise abroad. Refusal of foreign manufacturers to submit to such inspection would result in the exclusion of their products from the United States. Where the value of the goods exported to the United States cannot be ascertained, if they have been sold in this country for less than their home value, a duty shall be imposed on them, in addition to all other duties, equal to the difference between the sales price in the United States and the foreign home value, the value to the countries other than the United States, or the cost of production, as the case may be.

Completes Calibration of Oxyacetylene Apparatus

Washington, Dec. 16.—In a bulletin on the work at the bureau of standards it is stated that the calibration of oxyacetylene welding and cutting apparatus is practically complete. This work was delayed somewhat, it is said, owing to the fact that a method had to be devised for determining the effective specific heat ratio of acetylene passing through the acetylene meter. Work of actual welding is expected to start in a short time. The calibration of the oxygen-flow meters used in cutting has not yet been complete.

The bureau of standards this month is to undertake a strain-gage investigation of the new 350-ton fitting-out crane at the Philadelphia navy yard. Bureau officials expect to have difficulty in making the test because of the low temperatures and winds of high velocity now prevalent, but hope the investigation can be completed successfully.

Reject 442 Claims for War Minerals Pay

Washington, Dec. 16.—Charged with the adjustment of losses sustained in producing manganese, chrome, pyrites and tungsten, the war minerals relief commission up to Nov. 29, 1919, had recommended partial allowance of only 30 claims, involving $418,502.79, and had recommended the disallowance of 442 claims, leaving 731 to be considered, the total number filed with the commission having been 1203. These facts are carried in a report submitted to congress by Alexander T. Vogelsang, acting secretary of the interior.

The following tabulation summarizes the work and expenditures of the commission to the date named:

Total amount of claims	$16,655,481.94
Amount of the 472 claims already considered	$3,345,486.95
Amount of claims remaining to be considered	$13,309,994.99
Total number of claims recommended for disallowance	442
Amount claimed in those disallowed	$1,946,374.23
Total number of claims recommended for partial allowance	30
Amount claimed in those partially allowed	$1,399,112.72
Amount recommended to be allowed	$418,502.79
RECAPITULATION	
Amount of appropriation	$8,500,000.00
Amount of awards recommended	$418,502.79
Administrative expenses to Nov. 29, 1919	$147,431.25
Balance	$7,934,065.96

The relative large proportion of disallowances, the report states, should not be taken as an index for the future, for several reasons: First, the commission eliminated initially, as far as possible, claims which on their face admitted no request or demand. Second, some of the largest and most complex claims, requiring establishment of principles, demanded an excessive amount of time and study. Third, the examinations by engineers and auditors of most of the claims on which some award must be made are not yet complete.

Buys Brass Tonnage

Washington, Dec. 16.—The Van Dyke Smelting & Refining Co., New York, has purchased through negotiations closed here, approximately 5,500,000 pounds of surplus brass from the salvage board of the ordnance department. The price paid was 13.11c a pound, f.o.b. cars at place of storage. Most of the metal is located in the Boston district. The brass is in the form of 60-40 per cent rods in sizes 1¼ inches and larger, mostly not of commercial sizes. This material represents practically all of the declared surplus of this class of metal held.

Navy Contracts Awarded

Washington, Dec. 16.—The navy department last week awarded to the Carnegie Steel Co. contracts for most of the 7440 tons of special treatment steel plates and 3960 tons of nickel steel plates for battleships Nos. 49, 50, 51 and 52. The contracts were at the bid prices of 11.12 cents per pound of special treatment and 8.84 cents per pound of nickel plates.

Navy Steel Wanted

Washington, Dec. 16.—The navy department will open bids Dec. 19 on 10,000 tons of plates and 3350 tons of shapes to be used in the construction of battle cruisers Nos. 5 and 6 at the Philadelphia navy yard. Deliveries will begin in January, plates at a rate of 1800 tons monthly and shapes 600 tons.

Labor Leaders Express Defiance

Conference in Washington Devoted to Denunciation of Federal Courts and Employers —New Labor Party Fails to Obtain Support—Farmers Decline to Participate —Bolshevism "Repudiated"—Steel Strike "to be Continued"

WASHINGTON, Dec. 16.—Trade union leaders at their conference in this city last Saturday adopted a declaration of principles reasserting rights they always have claimed, and denouncing government "interference" with those rights. Articles containing 15 sections were drafted by the 200 union officials called here by Samuel Gompers, president of the American Federation of Labor. These ask for government operation of railroads at least until Jan. 1, 1922, to provide "a thorough test" of government control. Immediate ratification of the peace treaty also is urged. It is declared that the claim that increased wages must necessarily result in increased prices of commodities is false.

The 24 presidents of unions with membership including workers in the iron and steel industry voted to continue the strike four years "if necessary." Despite the statement of various plant officials that scarcity of coal is now the only restriction on operation, the labor leaders declared that the strike is still crippling the industry and that plans have been adopted for continuing the campaign. John Fitzpatrick stated that session of the 24 union presidents was "the most enthusiastic" held since the strike was called.

In the general declaration of principles, the labor leaders criticised federal courts for their actions, such as enjoining the leaders of the striking bituminous miners. The employers' group in the first national industrial conference also was criticised.

Rejects Pleas for New Party

The rejected attempts of some of the delegates to get recognition of the socalled national labor party, knowing that the federation could exert more influence through established political parties. It went on record against the bolshevists in its ranks, just as it has done in the past, regardless of its approval of the activities of some individuals of the syndicalist type, who have been seeking to "bore from within" the federation. The federation attempted to get farmers to join in the meeting, but they declined to do so, realizing their interests and the principles of the federation are opposed.

President Gompers presided at the principal session, and when a motion was made to obtain recognition of the labor party, Gompers curtly ruled the motion out of order. Instead of trying to organize a labor party, the conference urged workers to "seek redress for their grievances by exerting political pressure." Delegates took pains to say that workers will "defeat their enemies and elect their friends" through the medium of existing political parties, and by this action "approve" of the "new national labor party."

Much noisy condemnation of bolshevists was indulged in. The delegates appeared to be encouraged over the decining strength of the radicals.

The conference reiterated the right of federal, state and municipal employes to organize and affiliate with the federation in the face of the sharp challenges and defeats recently administered to such organizations. In urging adoption of the peace treaty the conference approved its labor provisions and gave complete endorsement to the principles the labor group tried unsuccessfully to force through at the recent industrial conference.

John L. Lewis, acting president of the United Mine Workers' union, was present at one of the meetings. Lewis said he was not directly concerned with the steel strike, but was present to get the steel men's decision first hand, and asserted that the future policy of the miners will be influenced in a degree by the steel workers' strike. Andrew Furuseth, chief pilot for the seaman's union in steering its legislative interests through congress, also was present, but his participation was "sympathetic" only. Fitzpatrick presided at this meeting, with his usual gusto, and Secretary Frank Morrison of the federation was likewise among those present.

The substance of the more important sections of the declaration of principles adopted by the conferees follows:

"Powerful forces are seeking more and more aggressively to deny to wage earners their right to cease work. We denounce this as vicious and destructive of the most precious liberties of our people. So long as it is necessary to exercise the right to cease work—strike—as a final means of enforcing justice from autocratic control of industry, so long must the workers maintain the right to strike."

This was amended to read: "The right to cease work—strike—as a final means of enforcing justice from autocratic control of industry must be maintained."

"The right of public employes to organize must at all times be fully safeguarded.

"The injunction writ has been abused.

"We declare these abuses in the exercise of the injunction writ are clearly violative of the constitution and that this issue must be determined definitely in accordance with the guarantees of the constitution of the United States."

"Workers are free citizens, not slaves. They have a constitutional right to cease working. The strike is a protest against autocratic management. To penalize strikes or to make them unlawful is to apply an unwarrantable and destructive method when a conservative one is available.

"The government has a greater obligation in this matter than to use its coercive powers. Legislation which proposes to make strikes unlawful or to compel the wage earners to submit their grievances or aspirations or governmental agencies, is an invasion of the rights of wage earners and when enforced makes for industrial serfdom or slavery.

"We hold that the government should supply information, assistance and counsel, but that it should not attempt to destroy voluntary retaliations and policies of mutuality between employers and employes.

"We specifically denounce the anti-strike provisions of the Cummins bill and all similar proposed legislation as unamerican, as being vicious in character and establishing by legislation involuntary servitude."

Steelworkers Increased in September

Washington, Dec. 16.—The first government figures showing the employment situation in the iron and steel industry since the commencement of the steel strike on Sept. 22 have been made public in the November issue of the monthly labor review published by the bureau of statistics in the department of labor. At the end of September, 92 steel manufacturers reported 146,298 men employed as compared with 141,664 on the last working day in August. This was a gain of 3.3 per cent.

It may be pointed out that if the last full working day in each month is not a fair comparison, perhaps the monthly payroll figures will be better. During September 102 manufacturers paid out $11,545,096 in wages, or only approxi-

mately 2 per cent less than in August. The numbers on the payrolls of these companies in the two months were 175,237 in September and 174,606 in August, an increase of approximately half of 1 per cent.

The comparisons with 1918 are, of course, less favorable, because September and August in that year found practically all mills operating at full capacity. For example, in September last year 104 companies employed 199,136 men with a monthly payroll of $12,824,070 while the same mills in September this year employed only 174,117 men to whom $11,389,023 in wages were paid. This was a loss of 12.6 per cent in men and 11.2 per cent in wages. The number actually working in 95 establishments on the last full day of September, 1918, was 165,168, while the number in the same plants on the comparative date this year was 148,749, or 9.9 per cent less. In discussing changes in wage rates the review says of the iron and steel industry:

"Two plants reported an increase of 10 per cent affecting the entire force in one plant and 95 per cent of the employes in the second plant. Increase of 2.5 per cent in the finishing mill and 5 per cent in the puddling mill were given by one establishment affecting 50 per cent of the employes. Four per cent of the employes in one plant received 0.26 per cent increase."

Texans Form Open-Shop Association

Employers in Beaumont, Tex., and vicinity have organized the Open Shop association of Jefferson county, Texas, with a view to disseminating information showing the advantages to the public of the open shop. The declaration of principles states that it is the purpose of the organization "by its teachings and good offices to prevent and avert industrial disturbances; to harmonize differences between employers and employes, with justice to all concerned and to insist on the enforcement of the laws of the land.

Other purposes are "to oppose restriction of output, sympathetic strikes, lockouts and boycotts and illegal prosecution of individuals; to secure for employers and employes the freedom of individual contract in the matter of employment; to prevent any interference with persons seeking through honest effort to work and earn an honest living, and to lend aid and influence to protect everyone in his lawful right to conduct his business or affairs as he deems proper, so long as he does not encroach on the rights of others."

Membership is divided into two classes, active and associate, the first being composed of employers and the second of those who are not employers but who believe in the principle of the open shop. A board of directors consisting of 21 members is chosen in accordance with a predetermined classification of industries as represented in the association. An executive committee of five elected by the board of directors has authority to act in the general management of the association. A penalty of not less than $500 and not more than $5000 is provided for members who wilfully violate the principles of the association.

Barring of Workmen is Ordered Stopped

Federal Judge Westenhaver at Cleveland, Tuesday rendered a decision, restraining Mayor Davis and Police Chief Smith of that city, from barring workmen who had come from other cities to work in steel plants there. The city administration, shortly after the breaking out of the steel strike, issued an edict to the effect, all men who came from other cities to work in the mills in Cleveland during the strike, would be arrested on charges of suspicion, and given the alternative of leaving the city or serving a term in the workhouse. It has been estimated that more than 300 men were forced to leave the city, as a result of this ruling, which was backed up by an ordinance passed by the Cleveland city council, and employers in the district blame the action of the city officials for the prolongation of the steel strike in the district.

By the decision of the federal judge the city officials cannot interfere with workmen coming into the city, and can arrest only those against whom legitimate charges can be placed. The city administration had claimed that they had found many of the men whom they had arrested were armed and were justified in arresting them. Judge Westenhaver rendered but a temporary report of his decision, but is expected to hand down a complete statement within a few days. The action was brought by the American Steel & Wire Co.

Frick Company Increases Wages 14 Per Cent

Announcement of an increase of 14 per cent in wages effective Dec. 1 has been posted by the H. C. Frick Coke Co., at its plants and colleries in the Fayette county, Pa., coal fields. The company decided to increase wages a week prior to the settlement of the coal strike, and at that time announced its decision, although the posting of notices was delayed until the result of the miners' negotiations at Washington and Indianapolis was announced. Fayette county is a non-union coal field and it is believed the Frick scale will be slightly higher than that agreed upon by which the miners in the union fields will return to work. A similar announcement by independent companies affecting other miners in Fayette county is expected to be made soon.

Agitators Held for Trial

More than 100 men who were arrested by state troops on Dec. 5 at Donora, Pa., when the officers raided the steel strike headquarters, were held for the February term of the Washington county court following a hearing Dec. 11. The men were charged with conspiracy and intimidation to prevent men from working in the steel mills at Donora. The arrests followed a bomb explosion at the home of Felix Burkhardt, an employe of the American Steel & Wire Co. at Donora.

Would Disbar Margolis

A petition asking the disbarment of Jacob Margolis, who it is claimed has attempted and still is attempting to overthrow the government of the United States and is wholly lacking in fidelity to our system of the government, which he swore he would obey and uphold when admitted to the bar, was presented Dec. 13 in the common pleas court at Pittsburgh by the Allegheny County Bar association. Margolis, it will be recalled gave startling testimony before the senate committee which investigated the steel strike and this disbarment action grew out of his admissions before that committee.

Cambria Workers Back

All except about 1000 of the workmen employed at the Cambria Steel Co., Johnstown, Pa., prior to the outbreak of the strike now are back at work. The men who still are out are chiefly foreigners. The company has 10 open-hearth furnaces in operation at the Franklin works and as soon as the coal situation improves, a marked increase in both steel works and finishing mill operations is planned.

Whitaker Glessner Co.'s sheet mill at Martins Ferry, O., employing 2000 persons, has resumed work in full, after being idle two months on account of the steel strike.

Foreign Market

For American Machinery Should Not be Neglected, Says Wood

American manufacturers of industrial machinery should not allow the present home demand for their product to cause them to ignore the future of the European market, declared Maj. Charles P. Wood, trade commissioner of the United States department of commerce, in a recent address before the Foreign Trade association of the Cincinnati chamber of commerce. Many machine tool manufacturers of the Cincinnati district were in attendance and heard Major Wood, who recently returned from Europe, discuss the subject of European demand for American-made machinery. He said in part:

New German-made machinery is available for quick delivery. The value of the mark at the present time has created an inducement which can not be overlooked by industries which must study economy regardless of other considerations. The supply of this machinery is limited, however, and there is no reason to believe that the German can arrange to give long credits in large amounts. Still, it is true that this situation provided the entering wedge for German machine manufacturers who may be expected to take full advantage of every chance to build up their business on a profitable basis for the future.

It will pay American machinery manufacturers to confine themselves to definite propositions. The field has been looked over in a general way so much that prospective customers have begun to wonder when the Americans are going "to get down to brass tacks." Intermediaries who add excessive profits have spoiled some good prospects and have made a bad impression. The French and Belgians prefer to deal direct with the principal or with his regularly constituted agent, who has authority as to terms and who is not merely looking out for his commission on the one proposition in hand.

There is, of course, a variety of light American machinery that can be handled to advantage through carefully selected French agents. Some of these are large mill supply houses carrying stock. American woodworking machinery is in demand, principally machinery for making interior finish and furniture, much of it being special. Projects for building flourmills in the French colonies may create a demand for the necessary machinery beyond that which can be supplied in Europe.

Forms New Axle Company

Within the next six months the Eaton Axle Co., Cleveland, will be established and it is hoped will be on an operating basis. The new company will be incorporated under the laws of the state of Ohio for $5,000,000 and construction soon will commence on a $1,000,000 building to be erected on a 15-acre site. J. O. Eaton, formerly president of the Torbensen Axle Co., Cleveland, which recently was purchased by Willys interests, is president of the new company and associated with him is V. V. Torbensen, one of the founders of the Torbensen Axle Co., and inventor of the internal gear principle for truck axles, and others formerly with the Torbensen company.

An initial 1-story building of the saw-tooth roof type, covering approximately 150,000 square feet, will be built. It will saw-tooth roof type, covering 150,000 square feet, will be built. It will provide for the daily production of 200 sets of beveled gear drive passenger car axles and 100 sets of internal gear truck axles operating in oil, the two types of axles to be produced by the Eaton company. Officials anticipate that the first year's production will comprise 30,000 sets of axles and predict that this output will reach 90,000 sets by the third year.

Rails Are Wanted

Sexton & Popham, Paris, are in the market for 35 kilometers of 60 centimeter portable rails with steel ties, the weight to be 9 kilos, 500 grammes per meter. This firm also is in the market for five steel locomotives of 60 centimeter gage, and of 5 to 10 tons capacity. It has no objections to purchasing second hand equipment, if not too old, and if in first-class condition. This business will be handled by George L. Sexton of Sexton & Popham, who is located temporarily at 288 East Milwaukee avenue, Detroit, Mich.

Wire Co. is Chartered

Capitalized at $1,500,000, the Washburn Wire Co., Providence, R. I., recently was incorporated. The company for several years has been carrying on business at Phillipsdale, R. I., and it is understood the new capitalization is the forerunner of plant extensions. The present plants of the company are engaged in the manufacture of iron and steel wire, and for some time have been unable to meet the demand. Incorporators are, Albert R. Palmer, Madison, N. J.; Frank R. Searles, East Orange, N. J., and George F. Handle, New York.

Addresses Foundrymen

At the regular monthly meeting of the New England Foundrymen's association, held Wednesday, Dec. 10, Frank B. Gilbreth, consulting engineer of Providence, R. I., spoke on "What Industry Must do to Allay Unrest and How it Must be Done." Mr. Gilbreth is an advocate of scientific foundry management and motion study work and his talk, which was illustrated, touched largely upon efficiency of workers in performing their every day operations. Some of the points he emphasized were greater conveniences for employes to cut down fatigue; instruction in proper method of handling work in order to reduce effort, and to increase speed; and payment based on production. The paper aroused a great deal of interest and was roundly discussed by those present.

Decline of German Casting Industry Revealed

(*Special Correspondence*)

London, Nov. 28.—How lack of fuel and other factors have paralyzed the German castings industry is graphically illustrated in statistics on the production of castings in Germany for the past three years, which have recently become available through the provisions of the treaty of peace. The statement, given out by the peace conference in Paris, does not mention what classes of castings are included, but from the quantities shown evidently all kinds of cast products have been lumped together, including steel, iron, brass and other nonferrous metal castings, together with possibly some ingots. The figures by months are as follows, in metric tons:

	1917	1918	1919
January	1,082,797	933,570	506,185
February	943,547	892,788	475,586
March	1,104,653	1,039,092	558,788
April	1,131,620	1,084,601	439,975
May	1,198,171	1,184,794	524,986
June	1,124,998	1,182,415	531,632
July	1,190,014	1,179,947	580,819
August	1,185,963	1,155,084	568,785
September	1,119,635	1,105,366	531,167
October	1,076,222	1,057,920	.....
November	1,007,731	565,706	.....
December	976,891	481,308	.....
Total for 9 months	10,081,407	9,757,657	4,717,923
Total for the year	13,142,241	11,862,621	.....

Starts Employes' School

The Clinton Wright Wire Co., Worcester, Mass., has started a school for the use of its employes. Attendance is optional and English, reading, writing and arithmetic will be taught. The initial enrollment was 70 men representing five nationalities. The teachers have so far been taken from the staff of the different departments of the company and the plan is to give over certain sessions to discussion of technical questions in connection with the company's work.

Corporation Expands at Duluth

More Land is Acquired and Preparations are Made for Construction of Two New Mills and Extension of Industrial Town of Morgan Park—New Budget to Include $5,000,000 For Part of Program Outlined By Judge Gary

Special Correspondence of The Iron Trade Review

DULUTH, Dec. 15.—Important developments are coming about in connection with the expansion of the United States Steel Corp.'s subsidiaries at Duluth. A semiofficial announcement was made recently that appropriations are to be made in the corporation's next budget for $5,000,000 to be expended in carrying through a part of the program outlined by Judge E. H. Gary, chairman of the corporation, in October, 1918. This includes two plants for the manufacture of finished steel products, the conversion of the rail mill and the installation of machinery for the manufacture of another line of products, and the extension of the Minnesota Steel Co.'s model town at Morgan Park for the housing of employes. Work on the conversion of the rail mill is progressing, and preparations are being made to start construction on the other plants. The cement block plant at the Minnesota Steel Co.'s property at Spirit Lake is now manufacturing blocks to be used in the construction of new buildings.

The Minnesota Steel Co. had more than 1360 acres of ground available for industrial purposes but recently purchased 20 additional acres at Spirit Lake and also 80 acres, to be diverted from the northerly half of the first division of Morgan Park. A contract has just been let for the building of a 500-foot addition to the coal dock and negotiations are proceeding for the purchase of another parcel of property to be used in extending the yardage at Spirit Lake available for the company's transfer railroad. A deal for the purchase of another block of 160 acres also is pending and may be closed soon.

Further interesting industrial developments are foreshadowed by the acquisition by the Duluth Corrugating & Roofing Co., a subsidiary of the Marshall-Wells Co., of three blocks of property in the vicinity of its plant at Ironton. This includes property formerly occupied by the Thompson Furniture Co., together with a 3-story brick factory building, besides 50 acres taken over from A. C. Volk. It is understood that the land acquired is to be utilized for industries to be established during the coming year.

Plan Defeat of Ore Tax

Progress is being made by the commercial and mining interests in range towns in the campaign to combat the agitation in the southern part of the state for a tonnage tax on ore. All the towns were represented at a recent organization meeting in Eveleth. It is understood that speakers will be sent into southern Minnesota towns to explain the position of the mining interests, and the damage that would result if the proposed measure is passed.

Regarding current operations on the ranges, it has been announced by officials of the Oliver Iron Mining Co. that a force of approximately 12,000 miners will be employed at its various mines in the Lake Superior district during the winter months in development work, and in stockpiling ore from underground properties. In addition to its regular program, the company will open up two new mines this winter, the Sweeney in the Hibbing district and the Wellington near Chisholm. At the latter mine, a new 8 x 20-foot three-compartment concrete shaft will be put down.

M. A. Hanna & Co. propose to continue stockpiling during the winter at all their underground mines and stripping work will be carried along at their La Rue and Wakefield open pits.

The Shenango Furnace Co. has included in its winter program development and stockpiling at its Tioga mine near Chisholm, and the stripping contract is expected to be completed at its Webb mine this month. It is estimated that a total of 3,300,000 cubic yards of overburden will have been removed at the latter property.

Despite the decrease in operations at manganiferous mines on the Cuyuna range during the past season, shipments of ore from that range made a much better showing than expected. They aggregated 1,819,935 tons as compared with 2,478,000 tons in 1918 and 2,422,864 tons in 1917.

The Phoenix iron mine on the Vermilion range has been taken over by the Phoenix Mining Co. from the Vermilion & Extension Co. The mine has been freed of water, and nonbessemer ore is being mined, three shifts of men now being employed.

Independent operators are anxious to see ore prices for 1920 fixed as early as possible in order they may be able to make their arrangements for the year's operations. They contend that as a result of high costs of labor and advanced freight rates they found it almost impossible to operate at a profit during the past year.

Shipbuilders Expect Future Business

INDEPENDENT of whether the government continues its ship construction program or not, America's shipbuilding industry is beginning to prove that it is here to stay, according to a bulletin issued by the Atlantic Coast Shipbuilders' association, and the frequently expressed belief that the great organization built up during the war would dwindle to prewar proportions with the return to peace conditions is not borne out by actual developments.

Despite labor difficulties, high costs, official restrictions and wholesale suspensions and cancellations of government contracts, the shipyards are today in a stronger position than ever before, says the bulletin. Although only a few months have elapsed since American shipyards became free to accept orders for private account, there are already on the ways and under construction more than 550,000 gross tons of merchant shipping. This amount is exclusive of all government work, and includes no wooden steamers or sailing vessels of any kind, being confined to steel vessels. With the addition of contracts placed, but upon which work has not been started, it is probable that the shipyards of the country have orders for almost

1,000,000 gross tons of ocean-going vessels.

These figures are unmistakable evidence of the belief of business in the efficiency of American shipyards and of confidence in the future of the American merchant marine. The confidence of the shipbuilding industry itself is shown by the fact that in a number of cases the yards have taken over ships upon which the government had canceled contracts and will complete them.

To appreciate the expansion of merchant shipbuilding facilities it is only necessary to compare the present position with that existing before the war. Figures for June 30, 1914, show that at that time the total of all classes of ships building in the United States was only 148,000 gross tons. Today one American concern alone is constructing for private account 20,000 tons more than all the shipyards of the country in 1914 and the present total is nearly four times the prewar aggregate. Construction on the ways today represents 200,000 more gross tons than a month ago. It is of interest to note that present construction is practically 100 per cent American, only one of the 118 vessels now building being for foreign account. American yards are now in a position to bid for foreign business. On the basis of present quotations British prices are slightly lower than American, but the difference is a little more than 10 per cent and is diminishing, while the yards of America are in a position to offer much quicker deliveries and produce in quantities.

Summaries prepared from the official classification records of the American bureau of shipping and Lloyd's Register show that of the 550,000 tons of steel steamers being constructed, only 36,300 tons are being built by the yards of the Pacific coast and Great Lakes districts, the remainder, or over 93 per cent, being in Atlantic coast and gulf yards.

While half of the vessels under construction are freighters, the growing demand for tankers is shown in the number of ships of this type being built. Further contracts for oil-carrying vessels are looked for, as the shipping board has decided to sell none of this type.

Ships now being built include: Freighters, 59. tankers, 34; trawlers, 11; fruit steamers, 6; oil barges, 2; ore carriers, 2; harbor scows, 2; motor vessels, 1; barges, 1; totaling 118.

The greatest amount of tonnage building for one concern consists of 14 freighters, aggregating 108,710 gross tons being built for the United States Steel Corp. by the Federal Shipbuilding Co. The Standard Oil Co. is adding six tankers to its fleet, aggregating 51,650 tons and an oil barge of 995 tons. The Standard Transport Co. is securing seven tankers aggregating 50,400 tons. Other tanker orders under way include four for the Gulf Refining Co., four for the Panamerican Petroleum & Transport Co., three for the Vacuum Oil Co., five for the Atlantic, Gulf & West Indies Steamship Co., one for W. R. Grace & Co., two for the Sun Co. and one for the Texas Co. Five trawlers are being built for the East Coast Fisheries Co.

The largest volume of work under way for private account is at the yards of the Federal Shipbuilding Co., which, in addition to the 14 steel freighters for the United States Steel Corp. is turning out five tankers, of 10,000 gross tons each, for various accounts and two freighters for the Freeport Sulphur Co., the total involved being 168,090 tons. The Bethlehem Steel Corp. is building two ore carriers and seven tankers, aggregating 94,193 tons. At the yards of the Sun Shipbuilding Co. there are being constructed eight tankers and a freighter, totaling 61,345 tons.

Terminals Firm Elects

W. D. Nesbitt, Birmingham, Ala., well known warehouseman, has been elected president and treasurer of the Port of Birmingham, Inc., and R. A. Brown, vice president and treasurer. This concern is constructing terminals at Short Creek, on the Warrior river and the work is being rushed in the hope of being able to handle some traffic within a month. The Tennessee Coal, Iron & Railroad Co. is making its second shipment of steel shapes for the Chickasaw Shipbuilding & Car Co. down the Warrior river to Mobile, rail being used to Tuscaloosa. When the terminals at Short Creek are completed movements will be direct from the Birmingham district.

To Rebuild Furnace

Arthur G. McKee & Co., Cleveland, have been awarded the contract for redesigning and rebuilding the blast furnace plant of the Wharton Steel Co., Wharton, N. J. The work will consist of remodeling and enlarging the two existing stacks and installing new equipment necessary to modernize the plant in all respects.

This makes a total of four blast furnace plants in eastern Pennsylvania being reconstructed at present by this firm of engineers and contractors, the other plants being the Crane Iron Works, Catasauqua, Pa.; the Thomas Iron Co., Hokendauqua, Pa., and the Eastern Steel Co., Pottstown, Pa.

The Weirton Steel Co., Weirton, W. Va., also has placed a contract with the McKee company for equipping their existing furnace with a revolving stock distributor, which makes a total of 112 distributors of this type now operating or under construction.

Plant Taxed by City

The Paterson, N. J., board of finance has ruled that the American Locomotive Co. must pay to the city $25,000, representing taxes due on 47 locomotives which were built by the company in its Cooke plant in Paterson for the Imperial Russian government. The locomotives which are valued at $500,000, were completed in 1917, dismantled and placed in cases for shipment to Russia. Lack of ships and changes in the Russian government made it impossible to move the locomotives so that they remained at Paterson. Last year, a tax of $11,000 was levied against the locomotives but was not collected. This year the taxes amounted to $14,000. Representatives of the American Locomotive Co., the Russian embassy and the Paterson chamber of commerce endeavored in vain to have the charges canceled.

Holds Annual Dinner

The annual dinner for the superintendents, foremen and office force of the Cumberland plant of the N. & G. Taylor Co., Philadelphia, was held on Nov. 22 at the Fort Cumberland hotel, Cumberland, Md.

The table was set in the form of a capital "T", and 31 men were present, representing all departments of the plant. During the course of the dinner a number of entertainment features were introduced, and addresses were made by L. Leslie Helmer, general manager, John Read, superintendent of tin house, Dan Williams, superintendent of open hearth department, E. W. Shinn, chief engineer, Isaac Berman, metallurgist, and Hollinshead N. Taylor, president of the company.

The Antigo Tractor Co., Antigo, Wis., has contracted with the Murray-Mylrea Machine Co., also of Antigo, to build its haulage machines pending the completion of its new machine shop. The tractor company is incorporated for $500,000. Its machine shop is expected to be completed by June 30, 1920.

Here and There in Industry

Live Information Which Records the Expansion of Various Lines of Productive Enterprise

THE Toledo Steel Products Co., Toledo, O., until recently the Lewis Steel Products Co., will move from its present location on Detroit avenue to its new plant on Summit street and the Maumee river, about Jan. 1. The institution is the outgrowth of a small business organized in the early days of the automotive industry by George Lewis, pioneer manufacturer of poppet valves. Later the Lewis Electric Welding Co. was merged with the Lewis Foundry Co., and the two became the Lewis Steel Products Co. In January, 1919, Mr. Lewis disposed of the business to A. R. Clas, who until that time had been in charge of the management of the Falls Motors Corp. of Wisconsin. Mr. Clas has associated with him as assistant general manager J. George Lude, and as factory manager, W. B. Childs, both of whom also had been identified with the Falls Motor Corp. During the past year considerable additional equipment has been installed and production correspondingly increased.

Ground was broken Sept. 18 for a new plant and in it all possible operations will be automatic from the unloading of steel and iron to the weighing and counting of the finished product. The plant includes a foundry, power and boiler rooms, departments for cleaning, inspecting and annealing, a plant for threading and cutting steel and a machine shop including a tool, screw machine, grinder and inspection department. Restrooms, lockers, showers and restaurant are provided for employes. The buildings are of concrete, brick and steel construction, with steel sash on all sides and full length skylights over the two main units. The plant will have a capacity of 50,000 to 60,000 poppet valves daily. Since the company expects to continue to operate its night shift, much attention has been paid to the artificial lighting. Plans of the buildings were prepared by A. C. Clas of Milwaukee, and the A. Bentley & Sons Co., general contractors, Toledo, will be able to complete the entire structure in the record time of 100 days.

* * *

DEBEVOISE-ANDERSON CO., pig iron dealers, 53 State street, Boston, recently secured the exclusive New England agency for the Temple Iron Co., at Temple, Pa. C. A. Wyatt is New England manager.

* * *

THE Paul J. Kalman Co., Milwaukee, has taken the contract to furnish the reinforcing bars required for a 7-story brick and reinforced concrete stock house, 100 x 120 feet, for the Hummel & Downing Co., Milwaukee. The contract will require from 100 to 125 tons of bars.

* * *

THE Southington Mfg. Co., Southington, Conn., has just completed its government contracts, making small drop forgings for the navy, and will now resume the manufacture of its tool line. In one year three drop forges at the company's plant turned out 800,000 small forgings.

* * *

UNLOADING machinery for the port of Baltimore, recently was purchased from the Wellman-Seaver-Morgan Co., Cleveland, by the Western Maryland railroad. Exact details have not been divulged. The Wellman company has closed several large contracts recently including one with the Goodyear Co., of California.

* * *

INCORPORATED under the laws of the state of New York for $50,000, the Sterling Car Body Corp., with office at 1 West Thirty-fourth street, New York City, intends to build and equip a plant for the manufacture of special automobile bodies a little later on. Ultimately the company plans to produce a complete car. S. W. Woodruff is president, D. H. Fessenden, vice president, and C. E. Lussenhop, secretary and treasurer.

* * *

THE officers and directors of the Morgan Spring Co., Worcester, Mass., resigned at a meeting of the stockholders, Dec. 2, on account of the taking over of the business by the Clinton-Wright Wire Co. The resignations of the following officers and directors were accepted: President, Paul B. Morgan; vice president, assistant treasurer and clerk, Charles F. Morgan; treasurer and general manager, Evan F. Jones, who is now vice president and general manager of the Elyria Iron & Steel Co., Cleveland; directors, the foregoing and Jerome R. George, Rufus B. Fowler and A. J. Mahue, all of Worcester. The corporation will not be dissolved according to Harry W. Goddard, chairman of the board of directors, but will continue its corporate existence on account of ownership of patents and trademarks which will continue to be used by the Clinton-Wright Wire Co.

* * *

IN ITS new location, 60 Mt. Elliott avenue, Detroit, the American Boiler Works, now is ready to produce smoke stacks, boilers, tanks, and other sheet metal products. Established 10 years ago, the business steadily has grown until its quarters at 2519 West Jefferson avenue became cramped and a larger plant was required. New and modern machinery has been installed at the new plant. Walter Burns and T. Johnson are the proprietors.

* * *

THE former Worcester, Mass., branch war factory of the United States Light & Heat Corp., Niagara Falls, N. Y., has been sold by the Boston district salvage board to the Foster associates, which owns the land. Negotiations for its occupancy are under way. The building, which was erected in 22 working days, was used during the war for the electroplating of booster adapters for gas shells, and is adapted for light manufacturing.

THE General Electric Co. has purchased the plant of the D. & W Fuse Co., Providence, R. I., and will use it to make small devices to supply the works of the company in various parts of the country. The company also has under consideration substantial additions to its other manufacturing plants. The General Electric Co. also recently purchased seven acres in Gloucester, Mass., a part of which was occupied by the Mead-Morrison Mfg. Co., East Boston, Mass., as a munition plant during the war, and will erect an 800-foot building.

PROPERTY of the Mansfield Glass Co., Lockport, N. Y., was purchased recently by President A. H. Dittmer, of the Dittmer Gear & Mfg. Co., of that city. It is busily engaged razing the buildings on the site, which fronts Green and Grand streets, preparatory to erecting a new plant. The plant will be of steel, brick and concrete construction and will have a floor space of 22,000 square feet. The company will specialize in making automobile, truck and tractor transmissions, gears and shafts and the contract calls for completion by January next. One order for $60,000 worth of transmissions, gears, etc., already has been received from a prominent automobile manufacturer. Mr. Dittmer was identified with the Packard Motor Car Co., Detroit, as its railroad man for four years. He was employed three years in the production department of the Thomas Motor Car Co., Buffalo and for four years was secretary to the president and manager of the technical department of the Chalmers Motor Car Co., Detroit. He then became purchasing agent and director of production and purchases with the Covert Gear Co., Lockport, N. Y., a position which he filled for about three years. The Dittmer Gear & Mfg. Corp. is capitalized at $125,000. An outfit of gear cutting machinery and other equipment has been purchased. W. J. Riley is the company's efficiency engineer.

DELIVERY of rolling mill machinery has begun at the plant of the Newton Steel Co., at Newton Falls, O., according to a recent announcement of the company. The plant, while rated as eight mill, will have four roughing mills in addition to other equipment. It will be operated throughout by electricity and is expected to be turning out black plates by March 1 while it will be sometime later before finished steel is produced.

* * *

THE Norton Co., Worcester, Mass., manufacturer of abrasives and grinding machines has received word from Germany that its manufacturing plant near Cologne again is back under the Norton control. This branch plant was established some years before the outbreak of hostilities but since the war no news concerning it had reached the Worcester management until a few days ago when its return was reported by European Manager John Sigel.

* * *

THE International Motor Co., 252 West Sixty-fourth street, New York, has bought the large plant of the Wright-Martin Aircraft Corp., at New Brunswick, N. J. Huge numbers of airplane engines were produced at this plant during the war. Prior to its acquisition by the Wright-Martin interests, it had belonged to the Simplex Automobile Co. It comprises a huge machine shop, gray iron and brass foundries and other departments. The Wright-Martin Aircraft Corp. plans to build a new aircraft manufacturing plant near Newark, N. J.

ONE of the interesting contracts recently closed by the Erie Crucible Steel Co., Erie, Pa., was for a large quantity of high speed steel for the United States navy, to be used at the naval ordnance plant at Charleston, W. Va. The award followed a test made at the Philadelphia navy yard where 18 different brands of steel were entered, three of which were favorably passed upon, namely those made by the Erie Crucible Steel Co., the Carpenter Steel Co., Reading, Pa., and the Crucible Steel Co. of America. All samples were heat-treated, 0.40 to 0.50 carbon, 3½ per cent nickel steel forgings. The cutting speed was about 65 feet per minute, the cut, $\frac{3}{16}$-inch deep and the feed was 0.044-inch per revolution. Each tool was run until the edge was burned off.

TRANSFER of the property and business of the Whiteley Malleable Castings Co., Muncie, Ind., to the Muncie Malleable Foundry Co., Muncie, was accomplished on Nov. 29, and the new owners took possession Dec. 1. Since the organization of the new company has not been perfected, the names of the probable directors have not been announced. However, most of the men interested in the new company are malleable iron men who reside in Michigan, although a considerable block of the stock is held in Muncie. The negotiations for the new owners of the Whiteley plant were conducted by J. N. Klock, manager of the Benton Harbor Malleable Foundry Co., Benton Harbor, Mich. The plant of the Whiteley Steel Co. is not affected by the transaction and will be operated by its present owners. J. Lloyd Kimbrough, of Muncie, largely is interested in the new Muncie Malleable Foundry Co.

PROGRESS is being made by the Link Belt Co., Chicago, toward completion of furnace buildings Nos. 7 and 8 at its Belmont foundry, Indianapolis. For the present, however, only furnace No. 7, of 15 tons capacity, instead of 10 tons like the present furnaces, will be installed. Purchases are being made of the necessary machinery such as tumbling mills, sand blast and other foundry equipment, sufficient to take care of the additional capacity. These improvements are housed in a building, 70 x 400 feet, and when finished it will complete the foundry as originally laid out. This Indianapolis foundry produces malleable iron chains for elevating conveying and power transmission purposes.

Here and There in Industry

Live Information Which Records the Expansion of Various Lines of Productive Enterprise

SCHEDULED to be the last word in modern foundries in the world and the equivalent in size and output of any in the world, the plant to be erected in Beloit, Wis., next year by Fairbanks, Morse & Co., will contain 495,000 square feet of floor space. It will be 500 feet wide by 900 feet long. The structure, including storage of flasks, iron, sand, etc., will be under one roof and will cover 11 acres of ground. It will be located north of the company's present power house, bordering the River road. An ultimate daily capacity of 350 to 400 tons of gray iron is contemplated which will mean the addition of a like number in other departments to take care of the increased production that will result. Plans and specifications rapidly are nearing completion, the raw material for construction work is being placed on the ground and work will commence as soon as open weather appears. Approximately $1,500,000 will be expended.

Every protection for the safety and health of employes and all modern and scientific foundry devices will be incorporated. Electric cranes will carry raw material to and from the cupolas. Electric grab buckets will unload molding and core sand as well as coke. Electric magnets will be utilized to remove the pig iron from the cars. Electric cranes and conveyors will carry molten metal from cupola to molds for castings weighing from a few ounces up to 10,000 pounds.

* * *

AN ADDITION to its plant at 930 Loughborough avenue, St. Louis, is being built by the St. Louis Machine Tool Co. This will practically double the capacity of this plant which specializes in grinding, polishing and tapping machines. The enlargement which was made necessary by the increasing demand will give the company about 13,000 square feet additional floor space.

* * *

THE McClintic-Marshall Co., Pittsburgh, has added further to its land holdings in the vicinity of Leetsdale and Ambridge, Pa., having just concluded a deal for 15 acres at Fair Oaks station on the Fort Wayne railroad. The property adjoins some bought by the company a year ago and also the holdings of the American Bridge Co. As far as can be learned the company plans no immediate improvements on the property.

* * *

ONE of the largest sales in the Hyde Park manufacturing district of Greater Boston was made recently to the Crowfoot Gear Works, Inc., Chicago. The property includes a large modern manufacturing plant formerly used by the Mason Regulator Co., Dorchester, Mass. It is the intention of the gear manufacturer to make extensive improvements which will result in making the plant one of the most modern of its kind in this section of the country.

STOCKHOLDERS of the Ohio Blower Co., Cleveland, have approved the changing of the name of the concern to the Ohio Body & Blower Co., which company has been incorporated under Ohio laws with a capitalization of 110,000 shares of no par common stock. The company has called for redemption at $105 a share the $400,000 preferred stock of the old company and $404,400 of common stock $100 par value was exchanged on a basis of five shares of new for one of the old. The company was organized 15 years ago, beginning the manufacture of ventilators and blowers of various sorts. Later it began the production of automobile hoods and other parts and finally it took up the manufacture of automobile bodies. Officers and directors of the company are: President, D. K. Swartwout; vice president and treasurer, H. H. Lind; secretary, W. E. Clement.

* * *

FIRE recently damaged the manufacturing departments of the Marchant Calcuga Machine Co., Oakland, Cal., and the accompanying loss was estimated to be heavy. It is believed that the fire originated in the heating plant. R. H. Marchant, president, stated that a fireproof vault had safely preserved the special dies needed in the manufacture of new machinery. Operations accordingly were resumed as soon as the damage was repaired.

* * *

THE Sheet Steel Products Co., Bryan, O., capitalized at $200,000 has acquired property one-half mile east of Michigan City, Ind., which formerly was owned by the Granite Brick Co. A force of men now are remodeling the building, 80 x 300 feet, making it a 2-story structure. The company manufactures pressed steel parts for automobiles and trucks and expects to commence operations in its new location in January, 1920, with a force of 200 men, which later will be increased.

* * *

TO INCREASE its facilities to supply the widespread demand for its products, the Van Dorn Electric Tool Co., Cleveland, has completed an additional 4-story plant affording 30,000 more square feet of floor space. This plant is devoted to the manufacture of portable electric drills, reamers and grinders, which are finding a growing use among shipbuilders and automobile manufacturers. Holes up to 2 inches in diameter may be drilled in iron or steel. All parts of the machines from the motors to the cutting of the gears, through the tempering and grinding processes to an accuracy within 0.00025 of an inch, are made complete in the Van Dorn plant.

Men of the Iron Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

JAMES H. GROSE, who is expected to resign as general superintendent of the Carnegie Steel Co. in the Youngstown district and is mentioned as the probable successor of William A. Thomas who recently resigned as president of the Brier Hill Steel Co., has enjoyed an extended, practical experience in the iron and steel industry. He also has won for himself the distinction of having risen from the position of a laborer for his first connection being with the old Morris Bridge Co. of Haselton, O. Mr. Grose was born in Michigan, but moved with has parents to Youngstown, O., when a boy. As a young man he entered the employ of the Morris Bridge Co., as a laborer and advanced to the position of machinist. Thrown out of employment when the plant of that company was destroyed by fire in 1887, he went to the Homestead, Pa., works of the Carnegie Steel Co. as foreman in the bridge department. For the next 25 years he was attached to the company's plants in and about Pittsburgh, being successively, superintendent of the structural mills at Homestead, head of the Schoen Steel Wheel works at McKees Rocks, Pa., and then superintendent of the Howard Axle works at West Homestead, Pa. In the summer of 1912, he was transferred to the Ohio works of the company at Youngstown, O., as superintendent of the mills and furnaces of that works and on Jan. 1, 1916, was made general superintendent of the Carnegie plants in the Youngstown district. In this capacity, the construction of the town of McDonald and the Carnegie mills there came under his general supervision.

Donald S. Michelsen is the new geneneral manager of the Worcester Pressed Steel Co., Worcester, Mass.

Harrison Loring, formerly purchasing agent of the Virginia Shipbuilding Corp., Alexandria, Va., has resigned. He is succeeded by H. C. Russel.

W. B. Ragatz, of the Union Carbide Co., is to be works manager for the Farmers Standard Carbide Co., Freydenburgh Falls, N. Y.

Samuel Stoneham, general superintendent of the Union Steel Casting Co., Boston, has resigned and the office temporarily is being filled by Vice President A. F. S. Blackwood.

Harry Connors is directing the operation of the foundry of the Pennsylvania Iron & Steel Products Co., Ellwood City, Pa., which recently resumed activity.

Charles Herrick, for the past 20 years superintendent of the Twin Bluffs plant of the National Fireproofing Co., La Salle, Ill., has been transferred to Hobart, Ind., to take charge of the company's plant.

M. M. Drake, formerly sales manager for the Deeming-Endsley Co., Chicago, now is manager of the railway supply division of the Pierce Co., Kansas City, Mo., with office in the Transportation building, Chicago.

James R. Conrad, who since 1914 has been associated with the Truscon Steel Co., Youngstown, O., sailed recently for Singapore where he will represent his company through the United Engineers, Ltd. Mr. Conrad's territory will include Siam and the Malay peninsula.

B. Frank Hiestand, who as noted in the Dec. 4 issue of THE IRON TRADE REVIEW, recently was elected vice president of the Pulaski Iron Co., Philadelphia, also is president of the Marietta Casting Co., Marietta, Pa.; president of the Exchange National bank of that city and senior member of the lumber firm of B. F. Hiestand & Sons, Marietta.

Don F. Kennedy, Detroit, manufacturers' agent, who for the past four years has been Detroit district sales manager of the Hammond Steel Co., Inc.; Syracuse, N. Y., has taken the agency for Michigan and Toledo, O., of the Towmotor Co., Cleveland, manufacturer of gasoline industrial tractors for use in and about manufacturing plants.

R. E. Talley, chief engineer of the electric furnace department of the George J. Hagen Co., Pittsburgh, will present a paper at a joint meeting of the Pittsburgh chapter of the American Steel Treaters society and the Steel Treating Research society to be held Monday evening, Dec. 22, at Hotel Chatham, Pittsburgh. Mr. Talley's subject will be, "Electric Heat Treating Furnaces."

Col. F. M. Dorsey was elected chairman of the Cleveland section, American Chemical society, at the chapter's annual meeting in Cleveland. Other officers elected are: Vice chairman, Dr. W. O. Tower; secretary and treasurer, W. R. Mott; L. C. Drefahl, Hippolyte Gruener, A. W. Smith and George Oenslager, counsellors, and H. D. Batchelor, W. M. Clark, R. D. Landrum, Hugo Schapiro and A. W. Smith, board of managers.

Howard M. Davis, superintendent of the sheet mills of the Gary, Ind., plant of the American Sheet & Tin Plate Co., has resigned to become general superintendent of the Newport Rolling Mill Co., Newport, Ky. His resignation is effective Jan. 1, 1920. Mr. Davis went to Gary nine years ago, coming from Scottdale, Pa., while the Gary mills were under construction, and has been in charge since that time.

George S. Vail, sales manager for Arthur G. McKee & Co., Cleveland, engineers and contractors, sailed from New York, recently, for England, where he will spend several months on business for his company in connection with the installation of modern blast furnace and steel plant equipment. Mr. Vail was accompanied by George Garrett who will establish an office and remain in England permanently as the English representative of Arthur G. McKee & Co.

Louis J. Krom, who has been managing editor of *The Metal Industry* for the past 11 years, has resigned to take a position as works manager of the new rolling mill of the West Virginia Metal Products Corp., Fairmount, W. Va. Mr. Krom is a graduate of Lehigh university and for 10 years was in the rolling mill industry at Waterbury, Conn., being one of the first chemists employed by a rolling mill of that city. Adolph Bregman, the new managing editor of *The Metal Industry*, is a graduate of the Colorado School of Mines, where he specialized in metallurgy. In his profession of metallurgical engineer he made a study of metallurgical furnaces.

Men of the Iron Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

GEORGE A. STEVENSON has been appointed manager of the recently established London office at 3 St. James place, London, England, of Victor E. Karminski & Co., Inc., 291-295 Broadway, New York City, international iron and steel merchants. Mr. Stevenson also is opening an office for his company at Eagle Chambers, Adelaide street, Swansea, South Wales. He is a native of America and is well known in the steel trade of this country as well as of England. For four years he was connected with Richard Thomas & Co., Llanelly, South Wales, manufacturers of tin plate, and for three years subsequently was with the Pemberton Tin Plate Co., Llanelly, manufacturer of circles, black sheets and tin plate. He later had charge of the metal department of the Asiatic Petroleum Co., London. Mr. Stevenson is the son of Edwin Stevenson who is said to be the first man to introduce tin plate in the United States. He brought out black sheets and tinned them in Elizabethport, N. J., but because of natural gas possibilities dismantled the Elizabethport plant and removed it to Gas City, N. J.

Ernest W. Pelton, mechanical engineer, for the past 16 years connected with the Stanley Works, New Britain, Conn., has been made manufacturing superintendent of the hardware factory. He will retain supervision of the electrical and power, as well as the engineering, mechanical and transportation departments.

Allan A. Ryan, formerly vice president of the Stromberg Carburetor Co. of America, New York City, recently was elected chairman of the board of directors. J. P. Coffin, who recently was elected to the board to fill the vacancy resulting from the resignation of H. C. Stutz, was named to succeed Mr. Ryan as vice president.

D. S. Devor, who for many years has been works manager of the Olds Motor Works, Lansing, Mich., recently was made manager of the Elizabeth, N. J., plant of the Willys Corp. His assistant is Frank H. Schuman, who until recently was superintendent of the plant of the Buick Motor Co., Flint, Mich. F. Sergardi has been appointed chief engineer of the Willys Corp. plant.

George D. Farnham, formerly power and heating engineer for Westinghouse, Church, Kerr & Co., New York, has become chief engineer of the power and heating department of the McCann-Harrison Co., Sloan building, Cleveland, engineer and contractor. J. J. Scales, formerly assistant chief engineer of the American Shop Equipment Co., has become chief engineer of the McCann-Harrison Co.'s industrial furnace department.

Frederick C. Van Derhoof, formerly general manager of the automobile department of the Standard Steel Car Co., Butler, Pa., resigned recently to organize the Bacon Motors Corp., New Castle, Pa., of which he has been made president. Other officers follow: F. W. Bacon, New Castle, vice president; George N. Glass, Pittsburgh, secretary, and E. C. Hopkins, New Castle, treasurer. H. L. Archey, of Philadelphia, has been named sales manager.

Carl Edward Johansson, scientist and inventor of Sweden has been touring in this country recently and last week visited the plants of the National Acme Co. and the Warner & Swasey Co., Cleveland, as the guest of the Cleveland Engineering society. Mr. Johansson claims to have perfected a gaging system of an accuracy never before attained. Educated in America, Mr. Johansson returned to Sweden 35 years ago and began the development of his gaging system while a toolmaker in the Swedish arsenal.

John H. Allison has joined the Pittsburgh sales engineering department of the Celite Products Co., New York, producer of insulating products. Mr. Allison is a graduate of the mechanical engineering department of the University of Pittsburgh and has been associated with the Crucible Steel Co. of America, Pittsburgh Valve Foundry & Construction Co., Pierce-Arrow Motor Car Co., Model Engine Co., Pittsburgh; American Brake-Shoe & Foundry Co., Erie, Pa., and the Pittsburgh Bridge & Iron Co.

W. E. Fisher, of St. John, N. B., recently re-elected chairman of the maritime branch of the Canadian Manufacturers' association, is president of the Enterprise Foundry Co., Sackville, N. B., and vice president of the Enterprise Hardware Co., Sackville, and Emerson & Fisher, Ltd., St. John. He is a past president of the St. John Hardware association and of the maritime board of trade and has filled other prominent positions in the commercial organizations of the province.

Charles J. Fancher, formerly assistant to the factory manager of the Hart & Hegeman Mfg. Co., Hartford, Conn., has accepted the position as head of the engineering department of the National Machine Co., Brattleboro, Vt.

Clinton B. Lamson has resigned his position with Swan & Finch Co., Providence, R. I., and has purchased the Providence Oil Co. The new concern will be known as the Lamson Oil Co. and will manufacture a full line of lubricating oils and greases.

Leopold Tschirky, has resigned as assistant purchasing agent of the Bethlehem Steel Co., Bethlehem, Pa., to become connected with the General Refractories Co., Philadelphia. Upon his graduation from Cornell university in 1912, Mr. Tschirky went to the Bethlehem company, where he worked for a period in the machine shops and transportation department, being transferred in December, 1914, to the purchasing department, in charge of the purchase of all raw materials, machine tool, mill, industrial and electrical equipment, as well as all construction and construction

H. H. Harris has been appointed manager for the heat-treating equipment department of the Quigley Furnace Specialties Co., 26 Cortlandt street, New York. Mr. Harris has devoted several years to the practical application of materials for heat-treating purposes, especially to steel mixtures and special alloys for carbonizing and annealing boxes, cyanide pots, etc. In his new connection he will give special advisory service to users of heat-treating equipment. Mr. Harris was formerly general sales manager for the Swedish Crucible Steel Co.

Will Erect Large Joint Plant at Toronto

The Canadian National Carbon Co., Ltd., and the Prest-O-Lite Co. of Canada, Ltd., jointly have purchased 10 acres at Bathurst and Davenport roads, Toronto, Ont., as a site for a large manufacturing plant. The plant, to be erected at once will be the largest manufacturing establisment erected in Toronto for several years and will consist of two buildings, one of which will be 80 x 400 feet, three stories with one section 80 x 80 feet, three stories, to be occupied by the Canadian National Carbon Co., while the second building for the Prest-O-Lite Co. will be 80 x 400 feet, two stories. The heating plant will be housed in a separate structure, 50 x 60 feet, and will have room for installation of additional boilers. All buildings will be of reinforced concrete frame, flat slab floors, mushroom type columns on 25 centers, steel sash and brick curtain walls. Each building will have two freight elevators. All toilet accommodations and stairways will be contained in towers erected outside of buildings.

Special rest rooms for female employes, shower baths, a dispensary with competent medical attendant; restaurant with modern, equipped kitchen, etc., will be provided.

It is expected that the plant will be ready for occupancy in May, 1920. At present the two companies are operating five plants at different locations in Toronto. In addition to this plant the Prest-O-Lite company will erect in the spring, a new acetylene gas plant in Toronto or immediate vicinity, to take care of the greatly increased demand for compressed gas for welding and cutting and that a large new storage battery warehouse and assembly plant will be erected at Winnipeg.

Lake Huron Steel Corp. Buys Plant Site

Purchase of 1.147 acres in the Indian reservation adjoining Sarnia, Ont., as a site for its proposed steel plant, has been made by the Lake Huron Steel Corp., recently organized by Detroit and Canadian capitalists with an authorized capital of $15,000,000. The Indians are said to have been paid $200,000 for the land, which will be developed immediately and building operations put under way. It is expected the company will produce alloy steel for the Canadian and United States motor industries. The company, when first organized, planned to build at Goderich, Ont., but this plan has apparently been abandoned. Those identified with the corporation include, S. A. Howard, 1834 Dime Bank building, Detroit; G. H. McCreath, of Goderich, Ont., and others.

Obituaries

MYER M. KANN, secretary and treasurer of the Pittsburgh Crushed Steel Co., died at his home in Pittsburgh, Dec. 10. Mr. Kann, who also was president of Harrison Bros., Inc., Amesbury, Mass., and a director of the Specialty Device Co., Cincinnati, and of the National Abrasive Co., Boston, was born in Pittsburgh, Sept. 2, 1857, and made his home in that city throughout his entire life. He was a member of the American Foundrymen's association, the American Society of Mining Engineers, the Pittsburgh chamber of commerce, and several of the Jewish charitable and philanthropic organizations.

H. S. Waterman, sales manager for the Hutchins Car Roofing Co., Detroit, died in that city, Dec. 1, after a 10-day illness.

John H. D. Smith, for 30 years treasurer of the Boston Belting Co., died at his home in that city, Dec. 9, following a short illness, aged 83 years.

Charles M. Hart, 67, head of the Hart Bros. Machine Works, Clarksburg, W. Va., and a prominent figure in the financial and business affairs of that city, died at his home there on Dec. 3.

William H. Crawford, for many years head of Crawford & Co., Worcester, Mass., new and second hand machinery, manufacturers' mill supplies, etc., now the Brierly-Lombard Co., died at his home in that city, Dec. 4, aged 79 years.

Frederic P. Stearns, Boston, widely known engineer, who was a member of the board of consulting engineers of the Panama canal, died at his home in that city, Dec. 1, aged 68 years. His plans were followed largely in the development of the Boston metropolitan water and sewerage systems.

Daniel Williams, 67, superintendent of of the open-hearth furnaces of the plant of the N. & G. Taylor Co., Cumberland, Md., died at the Western Maryland hospital, Dec. 9. Mr. Williams was a native of Wales but came to this country 28 years ago and had been connected with the N. & G. Taylor Co. for the past 17 years.

Stephen P. Brown, civil engineer, who recently resigned as vice president of Ford, Bacon & Davis, New York City, was drowned Dec. 6, at Sebec Lake, Dover, Me. Mr. Brown aided in the construction of the Pennsylvania terminal, New York, and had charge of the work of constructing the Canadian Northern railroad terminal in Montreal.

John Slote, aged 77, died Dec. 3 at his home in Buffalo, after a short illness. Mr. Slote was a member of the Delaney Forge & Iron Co., that city, for about 40 years and for many years was acting head of the business. He was born in April, 1842, and at the age of 20, entered the firm of W. L. Comstock & Co. One year later, he organized the firm of Wippert & Slote, furriers. In 1866, he became a member of the Delaney Forge Co., with which he was associated until his death.

Charles A. Moore, superintending engineer of a crucible company in Jersey City, N. J., consulting engineer of a graphite company in New York, and superintendent of building and equipment of the St. George Navigation Co., died recently at his home in Jersey City. Mr. Moore, who built the first refrigerating plant in the Panama canal zone, was connected with the Brooklyn Rapid Transit Co. nine years as chief engineer and was chief engineer of the Western Electric Co., New York, for five years.

Edward Zelleken, retired Joplin mine operator and one of the pioneers of the district, died at his home in Joplin recently. He was 80 years old. Mr. Zelleken came to this district from Cincinnati in the early '70s, locating in Baxter Springs, Kans., where he operated a brewery for a number of years. He came to Joplin about 1880, and became widely interested in mines, among them being the Galena Lead & Zinc Co. at Galena, Kans. Besides being a stockholder in the Miners bank, he owned a large amount of valuable property. His philanthropic activities, in which he gave liberally to various charities, were well known.

Men of the Machinery Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

J. O. EATON, formerly president of the Torbenson Axle Co., Cleveland, now is president and general manager of the Eaton Axle Co., that city, which is being organized to manufacture truck and automobile axles. V. V. Torbenson, one of the founders of the Torbensen company and inventor of the internal gear principle for truck axles, is affiliated with Mr. Eaton in the new enterprise.

Robert A. Weinhardt recently joined the engineering staff of the Supreme Motors Co., Warren, O.

Seymour A. Spencer has resigned as assistant purchasing agent of the Graton & Knight Mfg. Co., Worcester, Mass.

William A. Kuhnly has been appointed manager of the Martin branch of the Horton Mfg. Co., Bristol, Conn., which it has taken over in Rockville, Conn.

Herbert H. Dean recently was elected vice president of the Buffalo & Susquehanna Coal & Coke Co., Buffalo.

L. D. Stanton has been placed in charge of the Detroit district sales office, 459 Book building, recently established by the Sizer Forge Co., 244 Larkin street, Buffalo.

Louis Selmi, chief chemist, and Samuel Agnew, chief engineer, of the McKinney Steel Co., Cleveland, were injured in an automobile accident at Cleveland, Dec. 8.

R. H. Combs, who has been general manager of the Prest-o-Lite Co. of Canada for several years, recently was appointed general manager for the Canadian National Carbon Co.

Howard Morrill, a Boston engineer, has been appointed assistant agent of the Pepperell Mfg. Co., Biddeford, Me., of which his father, Ernest L. Morrill is agent. He will begin his duties Feb. 1.

Jomes A. Crotty, of the legal department of the American Steel & Wire Co., Worcester, Mass., and E. Kent Swift, of the Whitin Machine Works, Whitinsville, Mass., have been elected vice presidents of the Worcester county council, National Safety council, with headquarters in Worcester, Mass.

A. L. Pschaiden, of Detroit, has been appointed assistant production engineer of the newly organized Reynolds Motor Truck Co. which began operation in its new plant at Mt. Clemens, Mich., recently.

Ernest E. Whitney, an engineer, who formerly lived in Orange, Mass., has been placed in charge of the maintenance department of 27 plants of the American Can Co., with headquarters in New York.

J. B. Shickel of Howell, Mich., has joined Maj. I. H. Case of the Ohio Machine & Motor Co., American Trust building, Cleveland, Ohio distributor of lathes, presses and other machinery and a line of electric motors.

W. Wood Smith, for the past six years sales manager for the Stafford Co., Readville, Mass., builder of textile machinery, has resigned to join the executive force of the Manchester Co., Woonsocket, R. I.

Charles Nourse has severed his connection with the Heald Machine Co., Worcester, Mass., where he had charge of the engineering department, to accept a position with the Lombard Machine Co., that city. Victor Bergstrom succeeds him.

C. Sterling Bailey, who for several years has been assistant advertising manager of the Peerless Motor Car Co., Cleveland, has been placed in charge of the department, succeeding George E. Twitmyer, who recently became sales manager of the Stevens-Duryea organization.

Frank H. Wheaton has been made manager of the Cleveland headquarters of the Walcott Lathe Co., Jackson, Mich. Display rooms recently were opened at 1316 Ontario street, Cleveland, where the company's lathes, shapers, duplex die sinkers and cherrying cutters are shown.

Robert Kimber, formerly representative of the Firth Sterling Steel Co., McKeesport, Pa., in its Hudson river, Brooklyn and Long Island, N. Y. territory, has been appointed eastern sales representative of the Le Moyne Steel Co., with offices at room 1800 Church street, New York.

L. E. Bixler, purchasing agent for the U. S. Metal Goods Co., Cleveland, manufacturer of automobile parts and replacement parts for Ford cars, also formerly purchasing agent for Service Motor Supply Co., has resigned to accept a position with Fackers' Machinery & Equipment Co., Chicago.

Samuel T. Hobbs, sales manager of the lock washer department of the Hobbs Mfg. Co., Hartford, Conn., has resigned to engage in the independent manufacture of lock washers. He has in contemplation the organization of the Hobbs Lock Washer Co. However, the question of the use of that particular name is in dispute.

J. H. Drury, treasurer of the Union Twist Drill Co., Athol, Mass., and the new vice president of the O. S. Walker Co., Worcester, Mass., has been elected a director of the Merchants National bank of Worcester. Mr. Drury is a member of the executive committee of the Associated Industries of Massachusetts.

Clarence E. Mason, who for several years has acted in an official capacity in the sales department of the Graton & Knight Mfg. Co., Worcester, Mass., with which company he was identified more than 26 years, is now associated with the Warren Belting Co. of that city, in which he has acquired a financial interest.

M. J. Butler, managing director of Armstrong & Whitworth of Canada, Montreal, has retired from active business and now is living at Oakville, Ont. Mr. Butler was deputy minister and chief engineer of the Canadian department of railways and canals from 1905 to 1910, when he resigned to take the position of second vice president and general manager of the Dominion Steel Corp. In 1912 he came to Montreal to organize the Canadian branch of Armstrong & Whitworth which began operations in December, 1914, and rendered important service during the period of the war. Mr. Butler was created a C. M. G., by the imperial government for his efficient services in the railway department and has also received the title of L. L. D. He is a native of Deseronto, Ont.

Exchange Still Absorbs Interest

Violent Fluctuations Compare With Confusion of International Finance at Outbreak of the War in 1914—Stocks Continue Weak Also—British Steel Firm Discloses Peace Plans—General Financial News

BY JOHN W. HILL, FINANCIAL EDITOR

THE extraordinary exhibition of the foreign exchange markets continues to hold the center of the financial stage. So violent and drastic have the fluctuations become in recent weeks that some observers have been led to compare the situation with the chaotic upheaval which took place in the foreign exchanges upon the outbreak of the war in 1914. Those who hold this view believe that the result will be identical with what it was after 1914, namely "such a positive adjustment of international finance and trade to the new conditions that the immediate problem will very soon assume a new and intelligible shape."

Months ago the question of foreign exchange stepped forth from its moth-eaten academic seclusion and became recognized as a vital factor in America's future prosperity. Never has this realization been impressed upon American business men with such telling emphasis as last week when the pound sterling fell to around $3.65 or a discount of 24 per cent. In England's worst period during the Napoleonic wars the discount of the pound never went below a discount of 21 per cent.

Out of the discussion which has been stirred up by the exchange situation two schools of thought have grown up. One believes that the necessities of Europe are so overwhelmingly urgent that even the tremendous barriers of the depreciated exchanges will not suffice to curtail American export of cotton, food, many iron and steel products and machinery to the needy nations across the Atlantic. The other school is certain that exports are on the brink of a precipitate decline induced by the utter inability of European buyers to continue paying American prices and the excessive exchange premium in addition.

Exports Great Despite Obstacle

Thus far those who think Europe will be compelled to buy apparently are being sustained by the facts. American exports continue enormous despite the exchange barrier. England during one recent month imported from this country as much cotton as was taken in three months previously. Throwing of the bills representing these sales upon the market was in a large measure responsible for the alarming break in sterling exchange. Of the allies only England's and Belgium's imports from America are increasing. France and Italy are slowing down in their buying here vastly. The fact that England and Belgium are purchasing raw materials here harmonizes with reports that industries in those countries are rapidly regaining their normal stride. Belgium plants that were not destroyed are said to be running from 70 to 90 per cent of normal. England is increasing exports and cutting imports and restoration of her trade and financial equilibrium is in sight.

Sir George Paish the great British economist and financial adviser to the British government last week predicted an utter credit collapse in Europe if America does not ratify the treaty and hasten to the rescue with generous loans. In making the recommendation for an immediate grant of credits Sir George overlooks an essential factor in Europe's extravagance. People and governments in a majority of the countries most needful of aid refuse to face the cold facts of the situation. Without increased taxation greater national economies and some effort in the direction of liquidation of the staggering war debt by the government harder work and increased production and sensible spending by the people, enormous credit extensions from America would only aggravate a deplorable situation.

The stock market has been adversely affected by the sharp fall of the exchanges, although tight money, and the uncertainty surrounding the railroad situation have contributed to the hesitation in share quotations. Last week's increase in rediscount rates on government paper collateral announced by the federal reserve bank of New York was believed to have been directed at commodity speculation and hoarding rather than stock speculation. The former move of the reserve board early in November which was intended to prick the Wall street bubble has served its purpose well and the street has been remarkably subdued for a number of weeks. Brokers loans a month or more ago estimated as high as $2,000,000,000 are now not believed to be over $1,300,000,000, with overextended speculative borrowers weeded out and stocks held in stronger hands. With the credit situation respecting the share market well under control the reserve board is said to be turning its attention to commodity speculation which is a factor in inflated prices and the increased rate last week may be followed by another if no results are perceptible soon.

British Company Plans Great Expansion

(Staff Correspondence.)

London, Nov. 24.—At the recent annual meeting of the stockholders of Sir W. G. Armstrong, Whitworth & Co., Ltd., plans were outlined by J M. Falkner, chairman of the board of directors, for the issuance of 1,500,000 of ordinary shares and 1,500,000 of 6½ per cent third preference shares to take care of the vast peacetime expansion being undertaken by the concern. The company has successfully accomplished the adjustment of its business from a war basis, and is broadening its activities into many new fields to utilize the tremendous extension of its facilities necessitated by the war.

The company is now making iron and steel, locomotives, automobiles, machine tools and many other similar products and is one of the largest iron and steel and machinery companies in the world. Recently the company celebrated the conversion of its shell works at Scotswood to a locomotive manufacturing plant, by the official steaming and trial of the first locomotive completed of an order for 50 for the North Eastern railway. In picturing the company's present status and future prospects, Chairman Falkner said in part:

"Owing to the excessive amount of detail necessary to settle all claims for war work, it is impossible at this time to give an accounting of earnings and it will be some months before a

financial statement will be ready. However we are able to determine that, in spite of all the confusion and dislocation attendant upon an entire change of work, the present rate of dividend will be maintained for 1919 and probably for next year as well. In 1920 our peace work should be in full swing. We have no choice before us in these days of progress but to develop and develop again. We have, for various reasons, whether to control material of other makers or to find an outlet for material of our own, made several valuable alliances by which we have obtained control of other undertakings."

Chairman Falkner's inventory of the company's acquisitions include the Siddeley Deasy Motorcar Co., at Coverntry; the electrical works of Messrs. S. Crompton & Co., Ltd., Chelmsford; and the business of the construction engineers, of Messrs. A. & J. Main & Co., of Glasgow. In addition the company has large interests in Canada, Japan and Italy. The Canadian works are adapted for the production of tool steel, railway tires and other products. In the company's works at Manchester, Eng., elaborate extensions have been made including a new steel works. The company also has turned one portion of its war additions into a foundry while still another has been converted for the production of brass and aluminum castings of all sorts. Despite vast preparations for entering the peace markets of the world the company announces that it is maintaining a large staff of technical war experts who could convert the huge capacities back to war production at short notice if the emergency should arise again.

Passes Dividend

In order to maintain the company's financial position and fortify it against the uncertainties of the future the board of directors of the Charcoal Iron Co. of America, Detroit, has decided to pass the usual dividend on preferred stock, according to a statement of President F. W. Blair. In further explanation of the action, President Blair makes the following observations:

"In my letter of Nov. 12 last, I made mention of the unsettled business conditions which have confronted your company during the present year. Since that time the situation has been materially aggravated by the coal strike and its effect upon transportation facilities. This further manifested itself on Friday last when notice was received from the railroad administration of its inability to furnish train service sufficient to supply us with requisite raw materials. In view of the possibility that there will be no immediate betterment of the situation your board decided that ordinary business prudence demanded that the cash resources of the company be conserved to meet any contingency. This action in deferring payment of the preferred dividend will operate merely as a postponement of the dividend, which is cumulative. Your annual report will show that the earnings of the company for the year under the conditions we have faced, are satisfactory and the prospects for substantial improvement in 1920 are favorable."

To Make Auto Bodies

Incorporated under the laws of New York with $50,000 capital, the Sterling Car Body Corp., 1 West Thirty-fourth street, New York, plans to engage in the manufacture of special automobile bodies and at a later date may engage in the manufacture of a complete machine. The company plans to equip a plant for the manufacture of the bodies, been started. S. W. Woodruff is presibut as yet work on the project has not dent, D. H. Fessenden, vice president, and C. E. Lussenhop, secretary and treasurer.

To Issue Stock

Announcement is made that the Struthers Furnace Co., Struthers, O., is about to issue preferred stock to the amount of $1,250,000 which is to be offered at par. This is the first issue of the kind ever offered by the company, the stock having been closely held by W. C. Runyon and associates in Cleveland.

Financial Crop Ends

A SPECIAL meeting of the stockholders of Landers, Frary & Clark, New Britain, Conn., hardware and cutlery manufacturers, has been called for Jan. 6 to approve an increase in the capital stock from $5,000,000 to $6,000,000, par value $25. The corporation has no funded debt.

* * *

J. S. Holt & Co., Inc., Boston, builder of shoe machinery, has made an assignment for the benefit of its creditors of its machinery and tools to Michael F. Culliney.

* * *

The Southern California Iron & Steel Co., Los Angeles, has sold $500,000 first mortgage 6 per cent serial bonds. The company manufactures nuts and bolts.

* * *

For the six months ended Oct. 31 Gaston, Williams & Wigmore, New York, report a surplus after charges and taxes $10,572, bringing the total surplus up to $1,481,510. The chaotic condition of the foreign exchange markets, shipping dearth and the longshoremen's strike is reported to have seriously affected the company's earnings.

Strong Positi on

Shown By Coal-Tar Product s Due to Restricted Output

New York, Dec. 15.—Rest riction in coke production, due to the c oal shortage, and the sold-up conditio n of sellers are leading factors in the continued strength of the coal tar products market. Despite the str ong tone of the market again this week no further advances have been reported. Pure benzol is still held at 27 to 31 cents and 90 per cent at 23 to 25 cents. Toluol is quoted at 28 to 32 cents. These prices are for both spot and contract deliveries.

Owing to the deferred deli veries of benzol, few contract buyers a re in the market. However, there are a number of spot buyers, both fore ign and domestic, who are ready to snap up whatever odd lots of nearby material may be available. While the situation in toluol is not so tight, the market is strong, with a good demand and with prices tending upward.

Large quantities of naphthalin continue to be bought by the dye industry, and supplies are becoming scarce. This, however, has not affected prices. Naphthaline in balls is holding at 8½ to 9½ cents, and in flakes at 6½ to 7½ cents. Phenol is featureless, with government supplies being moved at the fixed price of 12 cents, f.o.b. eastern storehouses. Solvent naphtha is being bought in good quantities by the dye industry. For spot and contract delivery, this product is holding at 22 to 27 cents.

The contract market on sulphate of ammonia is nominal, owing to the sold-up position of sellers. Prices are tending upward, but are unchanged.

Coke Oven By-Products

Spot

Per Gallon at Producers' Plants

Tension Relaxes in Tool Market

Easing of Conditions Accompanies Improvement in Labor Situation—Much Prospective Business in Evidence for January Closing—List of 200 Tools Out in East—Several Sizable Crane Purchases Made and Inquiries Pending

ACCOMPANYING the relaxed tension in labor circles, an improved condition is noted in machine tool centers. In some districts, particularly Cleveland and Pittsburgh, this improvement is more prospective than actual, with a large number of users disinclined to close on equipment requirements until after the holidays. With others, however, the desire is present to get orders booked for the earliest possible delivery, since many makers are unable to offer anything better than three to six months delivery. A few users are asking that their orders be held up until later; these include the Nash Motors Co., Milwaukee. The Cleveland Automobile Co., Cleveland, has issued specifications.

One of the largest lists in recent weeks is issued by the Wright Aeronautical Corp., New Brunswick, N. J., calling for 200 new or used tools. The General Electric Co., Schenectady, N. Y., issues no large individual lists, but puts out inquiries almost daily for its various plants. The Willys Corp., Elizabeth, N. J., is said to have bought $600,000 worth of machinery in recent weeks. The Hurley Machine Co., Chicago, asks for eight or 10 tools; the National Mold & Machine Works, Clarksburg, W. Va., wants five. Large lists are expected soon from the following: American La France Fire Engine Co., Elmira, N. Y., which is to build a truck plant at Bloomfield, N. J.; C. R. Curtis, Newark, N. J., with others, is to build a $400,000 automobile accessory plant; Eaton Axle Co., Cleveland, which will build a $1,000,000 plant.

Canadian users who have issued lists recently, include: The Fraser Brace Shipyards, Ltd., Montreal, 12; Canadian Ingersoll Rand Co., Sherbrooke, Ont., four; McKinnon Industries, St. Catharines, Ont., 10. Canadian machine tool prices have advanced 30 per cent and sellers are busy. Prospective business is heavy. Used and rebuilt machinery finds a ready market, since deliveries on new tools are deferred from three to six months.

Pittsburgh district crane sellers expect the award of 14, 12 and 22 cranes respectively by the Union Shipbuilding Co., Baltimore; Westinghouse Electric & Mfg. Co., Essington, Pa., and the Follansbee Bros. Co., Pittsburgh, for Toronto, O. Further east, cranes move in lots of one or two, several such sales being reported. John Simonds Co., Long Island City, N. Y., however, asks for quotations on three and the Youngstown Boiler & Tank Co., Youngstown, O., wants two. Phelps-Dodge Copper Co., Bisbee, Ariz., is expected to award 15 electric cranes soon and the Bethlehem Steel Co. has delayed action on 11 for Lebanon, Pa., and four for Sparrows Point, Md. One Ohio crane builder will withdraw all quotations on Dec. 31, which is taken to mean an increase on Jan. 1.

Cerro de Pasca Copper Co., New York, bought one crane for Peru; W. R. Grace & Co., New York, is inquiring for one for Brazil, and the Standard Oil Co. is inquiring for one for shipment to South America. An export inquiry current in Cleveland, calling for boring mills and vertical milling machines, is issued by Arva Stroud, 120 Liberty street, New York City, dealer in machine tools.

Wright Aeronautical Issues List of 200 Tools

FEATURING the eastern equipment market is an inquiry for approximately 200 miscellaneous machine tools for the Wright Aeronautical Corp., New Brunswick, N. J. The company contemplates buying either new or used equipment, which, according to reports, is to be installed in a new plant to be established some time in the near future. The General Electric Co., Schenectady, N. Y., while not bringing out large individual lists, continues to issue new inquiries almost daily for equipment for its various plants, including two new plants, reported recently, at Rochester, N. Y., and Decatur, Ind., for the production of light motors. At the same time, this company has been continually placing orders.

A large buyer of late has been the Willys Corp., Elizabeth, N. J., its purchases up to date aggregating about $600,000. Approximately $400,000 worth of this business went to an Ohio manufacturer of special machinery. The Otis Elevator Co., New York City, which has been in the market for additional equipment recently is expected to close at once on a substantial list. At present several other good-sized lists are pending which are likely to be closed soon.

Of interest to the eastern machine tool trade is the announcement that the American La France Fire Engine Co., Elmira, N. Y., will erect a plant at Bloomfield, N. J., where a 21-acre site has just been purchased. The plant will produce motor trucks. The initial unit, it is stated, will comprise 100,000 square feet of floor space. Another northern New Jersey project is that being fostered by C. R. Curtis, Newark, N. J., formerly manager of the Splitdorf Electric Co., for the manufacture of automobile accessories. Present plans call for the erection of a $400,000 plant, to be located at Newark.

Outstanding in the eastern crane market is a list of 12 cranes for the Willys Corp., Elizabeth, N. J. Specifications call for one 15-ton handpower crane, with 28-foot span; one 5-ton electric crane, with 59-foot span, to operate a grab bucket; one 10-ton electric crane, with 38-foot

span, and nine 5-ton cranes, with 58-foot span. One of the 5-ton cranes is to be equipped with a 1-ton monorail hoist, as an auxiliary.

Included in the awards of the past week is a 70-ton triple hoist electric crane for the Cerro de Pasco Copper Co., New York. This crane will be erected by the Alliance Machine Co., Alliance, O., for shipment to Peru. Dwight P. Robinson & Co., 61 Broadway, New York City, has placed a 50-ton overhead crane with the Niles-Bement-Pond Co., that city. The crane is to be installed in a new power house to be erected by the Pennsylvania Service corporation, near Philadelphia.

The Otis Elevator Co., New York, has bought a 10-ton electric crane, with 56-foot span, from the Bedford Foundry & Machine Co., Buffalo. This latter company has also received an order for a 20-ton electric crane, with 50-foot span, for the Acme Road Machinery Co., Frankfort, N. Y. The American Metal Co., 65 Broadway, New York City, placed a 25-ton handpower crane with 40-foot span, with the Whiting Foundry & Equipment Co., Harvey, Ill. The Smidth-Lewis Foundry, Inc., 50 Church street, New York, has placed a 5-ton, 3-motor crane, with the Pawling & Harnischfeger Co., Milwaukee. The order of the Sun Shipbuilding Co. recently reported as being placed with Pawling & Harnischfeger, involved one 15-ton crane, 76-foot span; and two 15-ton cranes and two 20-ton cranes, 112-foot span. James Stewart & Co., 30 Church street, New York City, has awarded a 2½-yard bucket handling crane, with 20-foot span and 90-foot hoist, with the Champion Engineering Co., Kenton, O. This crane is for installation in a power house at the new plant of the Standard Oil Co., in Toledo, O. This latter company also is inquiring for a crane for South America, now being in the market for a 5-ton electric crane with 25-foot span, for Compania Transcontinnial de Petrolco, South America. Among the few awards of locomotive cranes to be noted, is a 20-ton Browning crane, bought by Stone & Webster, Boston, for Jeannette, Pa.

Additional recent inquiries include three 3-ton overhead cranes, 48-foot span, for the John Simonds Co., Long Island City, N. Y. Westinghouse, Church, Kerr & Co., 37 Wall street, New York City, are engineers in charge. The bureau of yards and docks will close bids Dec. 23 on three traveling hammerhead cranes for Norfolk. The cranes are to have a capacity of 5 tons at one stage of operation and 10 tons at another. A 5-ton locomotive tower crane is to be purchased for the Portsmouth navy yard. W. R. Grace & Co., 7 Hanover square, New York City, are inquiring for a 5-ton overhead crane for Brazil. The Youngstown Boiler & Tank Co., Youngstown, O., will install two 10-ton overhead cranes, which have been or are about to be placed.

The engineering department of the Phelps-Dodge Copper Co., at Bisbee, Ariz., has approved the award of the 15 electric cranes, for which that company has been in the market, to either one of two builders, and an announcement of the placing of this business is expected daily. Action on the cranes for the Union Shipbuilding Co., Baltimore, has been posponed, pending bids of additional crane builders. The Bethlehem Steel Co. continues in the market for its list of 15 overhead cranes, of which 11 are for Lebanon, Pa., and four for Sparrows Point, Md.

Fuel Shortage Slight Deterrent on Tool Buying

WHILE the uncertainties of operation on the part of machine tool users as the result of fuel shortage have been noted here and there in the Chicago district as a deterrent to further buying, the general situation has not been affected appreciably and the volume of business is as large as ever. At present larger buyers are not prominent, though the Samson Tractor Works, Janesville, Wis., has placed a little additional business. The Nash Motors Co. has asked some delay in delivery of some of its equipment as a result of delay in building operations at its Milwaukee plant. Another recent buyer asked March delivery for his equipment as his plant will not be ready until then. The Hurley Machine Co., Chicago, is inquiring for eight or 10 miscellaneous tools.

Among railways uncertainty still exists and the Chicago, Burlington & Quincy railroad is the only one showing signs of closing on long-dormant inquiries. Shipments of machinery for Belgium are about completed at the government machinery depot in Chicago and domestic buyers now have hope of something being done for them. Builders of roadmaking machinery, mining equipment and all branches of the automotive industry are most active. Deliveries continue to be extended and do not improve.

Cleveland Sellers in Midst of Apparent Lull

DISSOLVING labor disturbances has brought an improved tone in the Cleveland machine tool and equipment market. The ending of the coal strike with its consequent removal of fuel restrictions has made it unnecessary for makers' plants to shut down hence production will not be greatly curtailed. Several users, however, are disinclined to place their orders and will not until after Jan. 1, 1920. It is thought the apparent lull which exists at present will continue until well along after the first of the year. A few, however, who realize that even though they place orders now, deliveries cannot be had until the end of the first quarter and in some cases later, are negotiating for their requirements. This is true of the Cleveland Automobile Co., Cleveland, which has specifications out on some equipment to be purchased direct and delivered beginning in March, 1920. This company also is endeavoring to obtain some slab millers through the parent company, the Chandler Motor Car Co., Cleveland. The Foot-Burte Machine Co., that city, has started to place orders for the cranes for its new plant, having purchased two or three 10-ton machines the past week. This company likewise is understood to have received bids on a tentative list of machine tools. Engineers are busy lining up the plant's possible requirements and these will be purchased in small lots from time to time as needed.

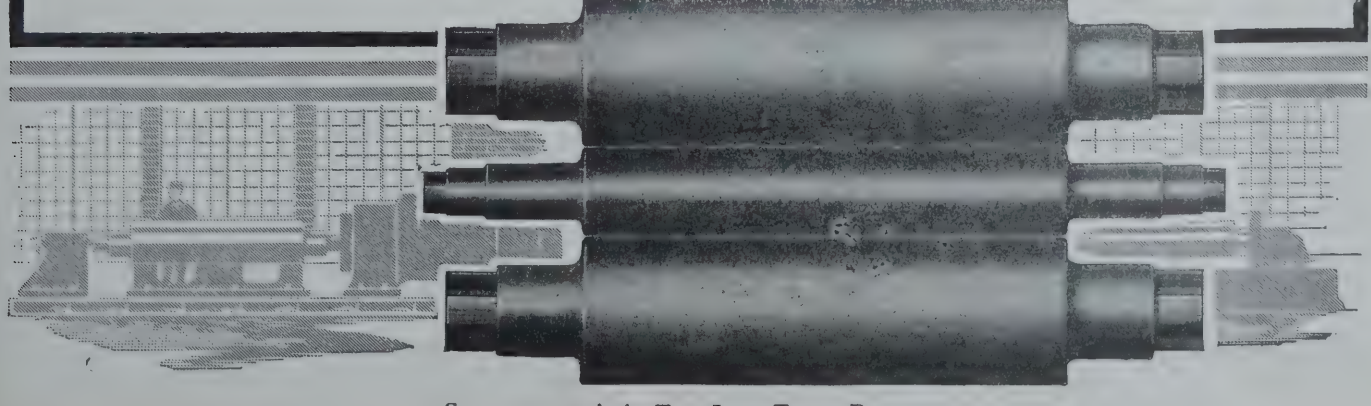
At present, a large number of hammer inquiries are finding their way to Cleveland dealers. These average three or four a day and cover one or two hammers of varying weights. Large lists are absent but smaller inquiries continue to be received in fair number. The U. S. Copper Products Corp., Cleveland, is in the market for a bar and billet shear. The National Mold & Machine Works, Clarksburg, W. Va., is in the market for five machines as follows: One 20-inch geared head engine lathe with turret and carriage; two 18-inch geared head engine lathes with regular equipment; one 6 x 6-inch power hack saw and one 20-inch power band saw. The Cleveland Metal Products Co., Cleveland, is understood to have closed on a press, filling its present requirements. The International Steel Tie Co., Cleveland, is receiving shipment on hammers ordered last October. The Carthage Foundry & Machine Works, Carthage, Mo., wants a new or second hand grinder suitable for flour mill rolls from 6 to 16 inches in diameter and up to 36 inches long. P. H. Bridge, Troy, O., is looking for a complete foundry and equipment, including a 10-ton crane. The Swenson

Rolling Mill Jim Does His Christmas Shopping Early.

Say, Fellas—

I had to look around a bit; couldn't use them HUBBARD ROLLS for Christmas presents; but when it comes to rollin' any derned kind of metal, why you can't beat 'em.

HUBBARD rolls are good rolls.



So Long,

Rolling Mill Jim.—

Hubbard Steel Foundry Co.

EAST CHICAGO, IND.

All Kinds of Iron and Steel Rolls and Steel Castings.

Say you saw it in THE IRON TRADE REVIEW

Evaporator Co., 945 Monadnock building, Chicago, will buy new or second hand foundry equipment in good condition for a gray iron foundry to be erected in northern Indiana. It will buy equipment for castings up to two tons, with a cupola of 5 or 10-ton capacity.

An interesting inquiry is current in Cleveland for export shipment. Arva Stroud, 120 Liberty street, New York City, has foreign clients who desire to purchase some used 48 or 52-inch boring mills and some model C Becker vertical milling machines with rotary tables.

While it is understood that the Eaton Axle Co., organized by former officials of the Torbenson Axle Co., which was recently purchased by Willys interests, has acquired a plant, it is anticipated that the new company will have extensive machine tool and equipment needs, since the initial unit of the plant will be valued at $1,000,000. The Eaton company will be incorporated with a capital of $5,000,000, and will produce two types of axles for passenger cars and trucks, respectively.

Projects which give promise of developing some interesting machine tool and equipment needs, include: Machine shops for the Summit Mold & Machine Co., Akron, O.; Advance Pump & Compressor Co., Battle Creek, Mich.; General Engineering Co., Alpena, Mich.; A. F. Oliver Gear & Machinery Co., Buffalo; new buildings for Thomas Steiner, 1499 Townsend avenue, Detroit, who has organized the Continental Trailer Corp.; American Gear & Mfg. Co., Jackson, Mich.; Vaille-Kimes Co., Dayton, O., to manufacture pumps; Michigan Crankshaft Co., Saginaw, Mich.; Enamel Products Co., Cleveland; Cameron Tool Co., Moundsville, W. Va.; and the Auer Register Co., 403 Long avenue, Cleveland, to build at East Thirty-seventh street and Payne avenue; additions for the Edmunds & Jones Corp., Detroit, manufacturer of automobile lamps; American Radiator Co., and the Stewart Motor Machinery Co., Buffalo; and the Erie Motor Car Co., Painesville, O., is to complete a building started before the war.

Several new tractor companies are about to enter the market for equipment. This include the Mackey Truck & Tractor Co., Akron, O.; Franklin Tractor Co., Greenville, O., branch of plant at Franklin, O.; Dayton Tractor Co., Dayton, O., formed by B. A. Brenneman with a capital of $250,000; Ground Hog Tractor Co., Holly, Mich., C. F. Megrow, president, capitalized at $250,000.

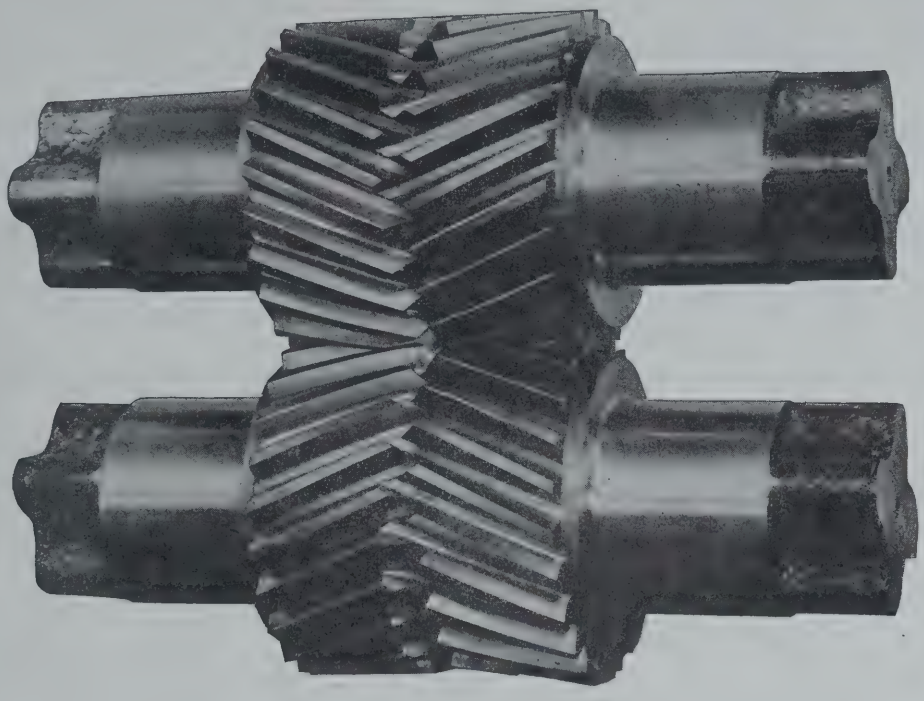
The Welver Piston Ring Co., Toledo, O., has increased its capital from $20,000 to $100,000 for purposes of expansion. The Jorgenson Mfg. Co., Waupaca, Mich., has increased capital from $70,000 to $3,500,000 and half of the new issue will be expended on new buildings and machinery. The Cree Drop Forge Co., Utica, O., is to engage in business at Newark, O. It recently purchased a hammer from a Cleveland seller. Engineer Charles F. Schultz, Cleveland, has charge of buying $35,000 worth of machinery for Wooster, O., waterworks.

Pittsburgh Seller's Prospects Are Good

PROSPECTIVE business in machinery and tools in the Pittsburgh district still is better than the actual, but this condition finds no reflection in plant activities, which still are brisk, though restricted here and there by a scarcity of raw materials. Tool builders are not inclined to become concerned over the fact that bookings are not heavier. They have so much business in drills, planers, lathes and milling machines that the best average delivery dates are three to four months ahead, while in some lines, six months is as early as deliveries are being promised. No big lists of machine tools recently have come out, but steady demands are being made for individual machines and such sales constitute a fairly large aggregate.

Some builders of cranes can take on more business for fairly early delivery, but as a number of them are unable either to make or buy sufficient supplies of steel castings, the work on hand is taking much longer to complete than otherwise would be the case.

The crane list of the Union Shipbuilding Co., Baltimore, which has gone out calls for 14 overheads of varying sizes, while that for the new turbine plant of the Westinghouse Electric & Mfg. Co. at Essington, Pa., calls for 12, eight of 10 tons and less and two 30-ton cranes with 5-ton auxiliary and two 50-ton cranes, also with 5-ton auxiliary. Both of these contracts will be let through this market. Nothing yet has been done on the crane requirements for the new plant of the Follansbee Bros. Co. at Toronto, O., which calls for 22 cranes in all.



As far as prices are concerned the market is showing sustained strength in all directions and recently a large Ohio crane builder sent out notice that the prices named against inquiries would be withdrawn on Dec. 31. This move, it is understood, is preparatory to a substantial advance made necessary by the big advance in the past few months in pig iron and other producing costs. If this action is taken by other makers, prompt closing of a number of orders is likely. It is reported that makers of steel and alloy rolls soon will announce the restoration of the prices in effect on Jan. 1, last, which would mean an increase of approximately 20 per cent over present prices.

Canadian Sellers Busy; Look for More Business in 1920

CESSATION of orders for machinery and machine tools is not apparent in the Canadian market. In fact, some dealers state, orders are coming in better than has been the case for some time and greatly increased business is anticipated after Jan. 1. In a few cases deliveries are being made more freely, but many dealers are unable to promise some new tools for delivery inside of six months. Price advances in the United States are reflected here and instead of only taking a slight increase a jump of about 30 per cent is made, chiefly due to the present high rate of exchange and duties. Dealers also are raising prices of rebuilt equipment and because of slow delivery on new tools a splendid demand is noted for second hand lines.

The Fraser Brace Shipyards, Ltd., 83 Craig street west, Montreal, inquired for the following equipment recently: One oil-heated angle iron furnace, one plate-bending roll; two vertical punching machines; six plate-punching tables; two single-headed shears; one horizontal punching machine; three radial countersinking machines; one angle iron cutting machine and an emery wheel. The Canadian Ingersoll-Rand Co., Sherbrooke, Que., is asking for quotations on one 10 x 20-foot planer; one 16 x 24-foot vertical extension boring mill; one 7-foot radial drill and one floor type boring mill with 6-inch spindle. The McKinnon Industries, Ltd., St. Catharines, Ont., are in the market for seven 14-inch engine lathes, and three 20 to 26-inch drill presses. Edward Neville, 130 Ontario street, Toronto, Ont., is in the market for a set of 48-inch sheet metal rolls. The Canadian Buttons, Ltd., 922 Visitation street, Montreal, Que., desires information on equipment for proposed factory. The Engineering Service, Ltd., 233 St. James street, Montreal, Que., is asking for prices on contractors' machinery and equipment.

Nearly every line of machinery and tools is in demand, and with the present government programs going through there is sure to be a greater number of requirements to be filled for equipment for public works early

MILL PINIONS

MADE FROM

Open Hearth Steel Castings

We own and operate one of the largest steel foundries in the West, making castings from 1 to 100,000 pounds.

THE FALK COMPANY

MILWAUKEE, WIS.

AGENTS: Pittsburgh—W. O. Beyer, 1007 Park Bldg. New York—M. P. Fillingham, 50 Church St. Wilkes-Barre—Vulcan Iron Works. Denver—Denver Engineering Works. San Francisco—F. W. Grimwood, Rialto Bldg.

in 1920. T. L. Church, chairman of the board of control, Toronto, Ont., is receiving bids until Feb. 10, 1920, for one or more 16,000,000 to 20,000,000-gallon centrifugal pumps for installation in the main pumping station. John T. Reid town clerk, Campbellton, N. B., is in the market for a direct connected, electric driven, 600-gallon per minute centrifugal pump, against 150 pounds pressure; also one motor, 220 volts, 60-cycle. The Toronto Lock Mfg. Co., Patterson place, Toronto, Ont., is in the market for a high speed ¼-inch riveter.

Construction and Equipment

Concise and Timely Business Building Opportunities from the Field of Industry

Among New England Plants

KITTERY, ME.—The Boston Maritime Corp. has been formed with a capital of $2,000,000 to engage in shipbuilding and branches. The incorporators are Harry W. Foster, George E. Burnham and Elmer J. Burnham.

PORTLAND, ME.—The Sanward-Cooper, Inc., has been incorporated to make iron, steel, copper, etc., with $10,000 capital, by F. W. Hinckley, F. E. Tarr and George Hinckley.

WINDSOR, VT.—The National Acme Co., Cleveland, will build a stock house and other buildings, at an aggregate cost of $250,000.

BOSTON.—The Simpson Patent Dry Dock Co. has let a contract for an engine house and repair shop.

BOSTON.—The American Pattern, Model & Mfg. Co. recently was incorporated with $20,000 capital, by George W. Johnston, John A. Christie and George Remick.

BOSTON.—The Weber Carburetor Co. has been incorporated with $400,000 capital, by Harold E. Clarke, Worcester, Mass., James L. Doyle and George E. Richardson.

BOSTON.—The Tinsel Products Co. has been incorporated to make metal goods with $50,000 capital by William W. Bevan, Charles G. R. Hanson, Melrose, Mass., and D. R. Hanson.

BOSTON.—The F. L. Horton Corp. has been incorporated to manufacture machinery, hardware, etc., with $700,000 capital, by Charles E. Fay, Harold V. Tillson, Brockton, Mass., and Fred C. Fernald.

CAMBRIDGE, MASS.—Bids have closed for a 2-story, 110 x 150-foot plant for the Eco Mfg. Co. manufacturer of piston rings.

CAMBRIDGE, MASS.—The Dover Stamping & Mfg. Co. has had plans prepared for a storage building and garage, 80 x 80 feet, to cost $36,000.

CAMBRIDGE, MASS.—The New England Spark Intensifier Co. has been incorporated to make auto accessories, with $5000 capital by G. F. Farnum Jr., Thomas F. Carey and Frank A. Keaney.

CHELSEA, MASS.—The Standard Welding Co., Inc., has been incorporated with $1000 capital, by Fred Freedman, Philip Greenberg, East Boston, Mass., and L. Freedman.

DORCHESTER, MASS.—The Mason Regulator Co. will erect a large addition.

GLOUCESTER, MASS.—The General Electric Co., Schenectady, N. Y., has purchased a tract of land here and will erect a plant.

HYDE PARK, MASS.—The Crowfoot Gear Works, Inc., Chicago, has purchased the property belonging to the Mason Regulator Co. and will rearrange and enlarge the plant.

LYNN, MASS.—The Smith Iron Foundry Co., 31 Marshall Wharf, plans a plant addition.

SPRINGFIELD, MASS.—The Storms Drop Forgings Co. has been organized to carry on a drop forging business and five acres have been purchased as a site for a plant.

SPRINGFIELD, MASS.—The Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa., has filed plans for an addition to cost $60,000. The building will be used for a punch shop.

TAUNTON, MASS.—Albert E. Lincoln will build a machine shop, 1-story, 40 x 150 feet.

TURNER FALLS, MASS.—The Martin Machine Co. recently was incorporated with $100,000 capital, by Frank J. Martin, Leon E. Turner and Waldo T. Ellis.

WALTHAM, MASS.—The Judson L. Thompson Mfg. Co., manufacturer of rivets, has started work on an addition, 50 x 100 feet.

WATERTOWN, MASS.—The Watertown Pressed Steel Co. recently was incorporated with $150,000 capital, by William H. MacDonald, Arthur E. Quilty, Newton, Mass., and William S. Murray, Somerville, Mass.

WESTFIELD, MASS.—Bids closed Dec. 15 for a 2-story, 40 x 80-foot addition to the plant of the Vitrified Wheel Co.

WILLIMANSETT, MASS.—B. F. Perkins & Son, Inc., Holyoke, Mass., machinery specialists, let a contract for a 22 x 121-foot press shop, which will be the forerunner of a large manufacturing plant to be built before spring. The building will cost $30,000.

WORCESTER, MASS.—The Simplex Player Action Co. has let a contract for a 4-story addition, to cost $100,000.

WORCESTER, MASS.—The Morgan Construction Co. has let a contract for an addition, 2-stories, 45 x 97 feet, to cost $25,000.

WORCESTER, MASS.—The Walden-Worcester, Inc., has let a contract for a second unit. The building will be 132 x 173 feet.

WORCESTER, MASS.—The Sanford Riley Stoker Co., Ltd., has purchased seven acres of the Worcester Machine Screw Co., on which it plans to erect a plant.

WORCESTER, MASS.—The G. M. C. Engineering Co. has been incorporated with $25,000 capital to manufacture and handle power equipment. The incorporators are John L. Gallivan, Frank Galvin and Lynwood M. Erskine.

HARTFORD, CONN.—The New England Mattress & Spring Co. has been incorporated with $25,000 capital, by Charles Weinstein, Joseph Rose and Daniel Davidson.

WATERBURY, CONN.—The American Chain Co. has had plans prepared for a plant, 100 x 128 feet, to cost $135,000.

North Atlantic States

NEW YORK.—The American Can Co. contemplates a new plant at Grand Rapids, Mich.

NEW YORK.—The Wilson Maulen, 781 East 142nd street, has had plans prepared for a plant.

NEW YORK.—The Gehnrich Indirect Heat Oven Co., 60 Franklin avenue, has had plans prepared for a garage building, one story, 75 x 100 feet.

NEW YORK.—The Consolidated Antique Brass Works, Inc., has been incorporated with $15,000 capital, by D. Ripp, L. Hoffman and D. Klein, 84 Avenue D.

NEW YORK.—The W. G. Knapp Watch Case Co., Inc., recently was incorporated with $50,000 capital, by F. H. Etches, G. W. Geiling, 52 Broadway, and T. Hartigan.

NEW YORK.—The Marco Bronze Co., lighting fixtures, etc., has been incorporated with $15,000 capital, by A. and M. G. Magui, and C. S. Rush, 521 Stone avenue, Brooklyn, N. Y.

NEW YORK.—Weymouth & Co., Inc., smeltig and refining ores, has been incorporated with $25,000 capital, by R. W. Weymouth, L. Weymouth and M. S. Brownold, 263 West Seventy-fifth street.

NORTH TONAWANDA, N. Y.—The Niagara Radiator & Boiler Co. plans a plant addition.

OSWEGO, N. Y.—The Sawyer Brass & Iron Foundry contemplates a foundry building at an estimated cost of $100,000.

ROCHESTER, N. Y.—The High Speed Hammer Co. plans an addition to its foundry, 55 x 82 feet.

ROCHESTER, N. Y.—The Galusha Stove Co. has had plans drawn for an addition to its foundry, 37 x 96 feet.

ROCHESTER, N. Y.—The Multipost Co., 69 Allen street, plans a plant, two stories, 30 x 67 feet, to cost $15,000.

ROCHESTER, N. Y.—The Co-operative Foundry Co. contemplates a storage building, one story, 34 x 140 feet, to cost $14,500.

EAST PITTSBURGH, PA.—The Westinghouse Electric & Mfg. Co. contemplates a plant addition.

ERIE, PA.—The General Electric Co. plans a machine shop.

MYERSTOWN, PA.—The McKneat Mfg. Co., iron and steel, has been incorporated with $6000 capital, by L. F. Krum and others.

PHILADELPHIA.—An $8000 factory addition is to be erected here by the Standard Dental Mfg. Co.

PITTSBURGH.—The Mine Safety Appliances Co. is reported planning a machine shop.

PITTSBURGH.—The Pittsburgh Knife & Forge Co. is reported planning a plant, one story, 60 x 450 feet, to cost $500,000.

PITTSBURGH.—The Hoffman Bergeber Mfg. Co. has been incorporated with $200,000 capital to manufacture machinery, etc., by Arthur L. Hoffman, Alwin Bergener, Herman Knoff, McKees Rocks, Pa., and others.

SHARON, PA.—The National Malleable Castings Co. will erect a steel plant, 100 x 300 feet.

YORK, PA.—The Road Machinery Co. plans a building, one story, 30 x 60 feet, to cost $10,000, and a boiler house, one story, 40 x 50 feet.

BLOOMFIELD, N. J.—A 21-acre site has been selected here by the American La France Car Engine Co. for a plant to make motor trucks. The first unit will contain 100,000 square feet.

CAMDEN, N. J.—The Delaware Shipbuilding & Repair Co. contemplates a machine shop, one story, 25 x 100 feet, to cost $50,000.

NEWARK, N. J.—The National Welding Co. will erect a 1-story, 40 x 95-foot factory addition.

NEWARK, N. J.—A 40 x 220-foot warehouse will be erected here by the Upson Walton Co., for the storage of wire.

NEWARK, N. J.—The United Tube Co. has been incorporated to manufacture metal tubing, radiators, manifolds, etc., with $20,000 capital.

NEWARK, N. J.—The Qualitoy Co. has purchased the property of the American Hammered Piston Ring Co. of Baltimore. The premises will be improved by a series of 1-story factory buildings.

NEWARK, N. J.—C. R. Curtis, formerly manager of the Splitdorf Electric Co., contemplates an 8-story factory building comprising 180,000 square feet. It will be used for the production of automobile accessories, and will cost approximately $400,000.

BEDFORD, VA.—The Bedford Iron & Steel Works, recently incorporated here, will erect a foundry and machine shop, according to a report. J. J. Scott is president.

RIVERTON, VA.—The Shenandoah Milling Co. plans a hydroelectric plant.

Central States Activity

CHIPPEWA FALLS, WIS.—The Yates & Johnson Co. is erecting a foundry and machine shop, 125 x 200 feet.

CLEVELAND, WIS.—The Cleveland Welding & Mfg. Co. is erecting a 1-story plant addition, 60 x 120 feet.

COLFA, WIS.—The Colfax Light & Power Co. will spend about $200,000 to increase the capacity of its hydroelectric plant.

GREEN BAY, WIS.—The Northern Corrugating Co. is having plans prepared for a second manufacturing unit two stories, 100 x 100 feet. H. W. Krueger is president.

JANESVILLE, WIS.—A new planing mill costing about $25,000 will be built and equipped with new machinery by the Fifield Lumber Co. The building will be 70 x 100 feet.

KENOSHA, WIS.—Eskil Lindstrand plans a machine shop and garage building, to cost $25,000.

KENOSHA, WIS.—Articles of incorporation have been filed by the Tri-Clover Machine Co., which will engage in a general machine shop and foundry business. Organizers of the company are, L. C. Thomsen, Thorwald Jensen and Ole Rasmussen. The company is capitalized at $30,000.

LACROSSE, WIS.—Articles of incorporation have been filed by the Linker Electric Co. with $25,000 capital. The company will manufacture, repair and deal in elctrical machinery and quipmnt. John L., Philip and Emma Linker ar the incorporators.

LACROSSE, WIS.—The Trane Co., Detroit, manufacturer of vacuum heating systems, has a site here on which it plans to erect a branch plant, two stories, 62 x 80 feet, to be equipped for the manufacture of radiator traps, centrifugal pumps, etc.

LOMIRA, WIS.—The Lomira Furniture Mfg. Co. has started work on a woodworking plant, 50 x 140 feet, and a dry kiln, 42 x 42 feet. Machinery is being purchased. Albert Sterr is president.

MARINETTE, WIS.—The Victory Bag & Paper Co. will erect a 2-story mill addition, 100 x 100 feet, and will install new special machinery, tank equipment and devices for the making of paper and paper bags. A. M. Parevia is general manager.

MARSHFIELD, WIS.—The Felker Bros. Mfg. Co. contemplate a 1-story plant addition, 75 x 150 feet, to be equipped for the manufacture of steel culverts and metal barn equipment. About $50,000 will be expended.

MENASHA, WIS.—The Whitmore Foundry & Machine Co. has let contracts for a plant addition, 60 x 126 feet. A craneway will run the length of the building.

MILWAUKEE.—The W. F. Seaman Co., 480 Virginia street, contemplates a plant, to cost $50,000.

MILWAUKEE.—The Milwaukee Auto Engine & Supply Co. will start work soon on a plant, one story, 120 x 120 feet.

MILWAUKEE.—The Mueller & Son Co. will electrify its entire drive by the installation of a large generator and 65 motors of various sizes.

MILWAUKEE.—Articles of incorporation have been filed by the Sterling Tool & Mfg. Co. The company is capitalized at $25,000 and will manufacture machinery. The incorporators are E. G. Patek, Harry R. Kuntz and Louis Wiener.

OSHKOSH, WIS.—The Wisconsin Parts Co. has broken ground for a 1-story plant addition, 30 x 240 feet, to be equipped with milling machines, boring mills, lathes, grinders, etc., for which contracts are now being placed.

RACINE, WIS.—The Hamilton-Beach Mfg. Co. is having plans prepared for a 3-story plant addition, 60 x 400 feet, to cost $135,000.

SHULLSBURG, WIS.—The M. & P. Mining Co. has been incorporated with $50,000 capital to do prospecting and mining of lead, zinc, spelter, etc., in southwestern Wisconsin. George S. Huxtable, R. W. Blackstone and R. A. Fox are the incorporators.

WEST BEND, WIS.—The West Bend Aluminum Co. contemplates a plant addition.

BAY CITY, MICH.—The American Road Machinery Co. will erect a plant, 50 x 200 feet, and a foundry on a 90-acre site.

DETROIT.—The Detroit Range Boiler & Steel Barrel Co. has started work on an office building addition, one story, 32 x 41 feet.

DETROIT.—The Crescent Tool Co. has been incorporated with $50,000 capital, by William Shenk, Charles Heunebeck, Emil Gloor and others.

DETROIT.—The Master Products Co. recently was chartered with $25,000 capital by William K. Cochran, 22 Taft avenue, and others, to manufacture aircraft and automobile motors.

DETROIT.—The Detroit Structural Steel Co. has been incorporated with $75,000 capital, to manufacture and deal in ornamental steel and iron, and foundry products, by Isaac Goldberg, Harry L. Harris and Max Rothenberg.

FLINT, MICH.—The Flint Foundry Co. has taken over the plant of the Marshall Foundry Co.

FLINT, MICH.—The Flint Pattern & Foundry Co. will build a plant 40 x 100 feet, costing $80,000.

GALESBURG, MICH.—The Kalamazoo Chain Co., recently organized by Chauncey Hodges to manufacture automobile tire chains, will erect a plant, 80 x 125 feet.

GRAND RAPIDS, MICH.—The Hackett Motor Car Co. has changed its name to the Lorraine Motors Corp., and plans a 100 per cent increase in manufacturing facilities.

GREENVILLE, MICH.—The Regle Brass Co., according to a report, will locate its plant in this city.

IMLAY CITY, MICH.—The Imlay City Foundry Co. has been incorporated with $25,000 capital by Herman A. Chriscinske, P. W. Mulder and Will Borland.

JACKSON, MICH.—The American Gear & Mfg. Co. will build a plant 169 x 280 feet, costing $180,000.

JACKSON, MICH.—The Jackson Metal Products Co. has let contracts for a $50,000 addition. John Stern is president.

LANSING, MICH.—The Atlas Drop Forge Co. has let a contract for a plant addition. New equipment is being ordered.

MONROE, MICH.—The J. L. Fusner Corp. has been chartered with $25,000 capital by J. L. Fusner and others to manufacture sheet metal specialties.

MUSKEGON, MICH.—Manning, Maxwell & Moore, New York, owner of the Shaw Crane Co. at Muskegon, will build a plant for the manufacture of machine tools and gas engines, including a foundry, at a cost of about $2,000,000.

SAGINAW, MICH.—The Nelson Motor Truck Co. is building an addition, 70 x 130 feet, pending erection of an entirely new plant.

TRAVERSE CITY, MICH.—The Napoleon Motors Co. contemplates new buildings to replace units damaged by fire.

AURORA, ILL.—The Richards-Wilcox Mfg. Co. will build a 2-story plant costing $125,000. F. D. Chase, Inc., Chicago, is architect and engineer.

CHICAGO.—The Western Foundry Co. has had plans prepared for an office building.

CHICAGO.—The Walker Vehicle Co. has had plans prepared for a plant, 20 x 528 feet.

CHICAGO.—The Automobile Construction & Repair Co. plans a machine shop, to cost $10,000.

CHICAGO.—The Federal Electric Co. has plans for a plant, 27 x 306 feet, to cost $150,000.

CHICAGO.—The Sloan Valve Co. has a permit to erect a plant at an estimated cost of $25,000.

CHICAGO.—The Standard Screen Co., 1850 Hastings street, plans a plant addition, two stories, 50 x 70 feet, to cost $25,000.

CHICAGO.—The Tarrant Foundry Co., 369 West Grand avenue, contemplates a storage building at an estimated cost of $12,000.

CHICAGO.—The Player Phone Talking Machine Co. has had plans prepared for a plant, two stories, 157 x 163 feet, to cost $100,000.

CHICAGO.—The Joseph F. Kiesler Co., 929 North Huron street, machinery manufacturer, is building a one and 2-story plant, 69 x 75 feet, costing $13,500.

CHICAGO.—The American Foundry & Equipment Co., 2931 West Forty-seventh street, is building a foundry, 100 x 300 feet, to cost $160,000.

HARVEY, ILL.—The Buda Motor Co. contemplates a foundry, 140 x 160 feet, to cost $75,000.

Here's Another Case of Reliability

THIS 65 H. P. Link-Belt Silent Chain Drive, installed in 1906 in the plant of the Archer Daniels Co., for operating Heaters, has seen constant daily service 24 hours per day—and without the expenditure of one cent for repairs,

It is practically the equivalent of 26 years service. The chain was taken off the drive twice a year and cleaned. It is still in service. Details will be furnished upon request on this and numerous other drives in operation for long periods.

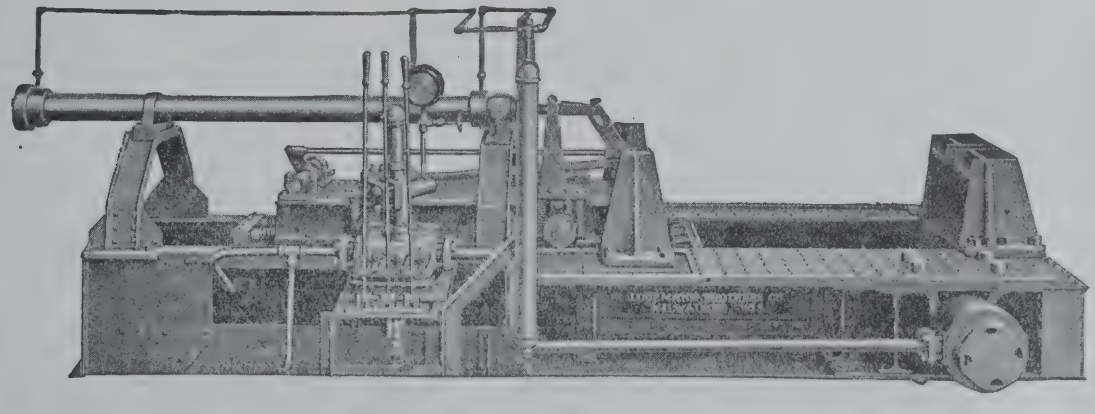
When the Scrap Market Is Dull

While seeking a more favorable market the best form in which to hold your sheet scrap, etc., and the form that always commands the best prices is the dense hydraulically compressed bundle.

Thus less storage space is required—under roof to prevent loss from corrosion; and because of greater car tonnage under minimum car rate, you add from 25% to 50% freight savings to your profits.



For greatest compression, largest daily output, at lowest operating cost, use

LOGEMANN Double Ram Hydraulic Scrap Metal PRESSES

You can enjoy the advantage of the accumulated experience from hundreds of Logemann scrap bundling presses now in use.

They embody a simplified mechanism that requires no special skill to operate rapidly. Press and pump are so designed that all the motive power applied is utilized, thus reducing power cost.

Powerfully built, all working parts constructed to resist the severest strains—selected material, first class workmanship—all minimize upkeep cost and insure lasting efficiency.

A medium sized press is shown; there are smaller and larger sizes in standard models.

Advise character and daily tonnage of your scrap and let us suggest press best suited to your requirements.

Logemann Brothers Co.

3126 Burleigh Street
Milwaukee, Wis.

Builders of Baling Presses and Hydraulic Machinery

(*Concluded from Page* 1679)

MOLINE, ILL.—The Waterloo Gas Engine Co. has had plans prepared for a plant to include a main factory building, one story, 100 x 160 feet, and a core building, one story, 120 x 140 feet.

ROCK ISLAND, ILL.—The Rock Island Stove Co. is having plans made for a plant 50 x 144 feet.

URBANA, ILL.—Machinery and other equipment for the Clifford Jacobs Forging Co. is being installed.

DECATUR, IND.—The contract for a factory building here for the General Electric Co. has been awarded to the H. K. Ferguson Construction Co., Cleveland. The building will be 260 x 360 feet.

ELKHART, IND.—The Indiana Aluminum Utensil Co., capitalized at $400,000, has been chartered to manufacture aluminum utensils by John I. Liser, James A. Bell and Carl D. Greenleaf.

EVANSVILLE, IND.—Plans are being drawn for an addition to the plant of the Advance Stove Works.

EVANSVILLE, IND.—The Evansville Paint & Varnish Co. will build a plant at an estimated cost of $25,000.

EVANSVILLE, IND.—Graham Bros., manufacturers of trucks and tractors, have completed the foundation for a $40,000 office building.

HAMMOND, IND.—The American Iron & Metal Co., capitalized at $10,000, has been chartered to deal in iron and metals by John A. Gavit, James K. Stinson and Samuel Abalman.

INDIANAPOLIS.—The L. H. Van Briggle Chemical Co. will erect a new building.

INDIANAPOLIS.—The La Fayette Motors Co. McCall White, president, will build a 1-story plant, 100 x 1000 feet.

INDIANAPOLIS.—The William Small Co., William Small, president, 33 West Eleventh street, will build a 1-story plant, 70 x 480 feet.

INDIANAPOLIS.—The Dean Bros. Steam Pump Works is reported planning a machine shop, two stories, 27 x 120 feet, to cost $20,000.

INDIANAPOLIS.—The Wolff Mfg. Co., an Illinois corporation, has qualified to do business in this state. The company manufactures plumbing supplies

INDIANAPOLIS.—The Prest-O-Lite Co., R. A. Hays, purchasing agent, Speedway City, will build a 2-story battery house, 100 x 400 feet, costing $400,000.

INDIANAPOLIS.—The Parts Corp., capitalized at $25,000, has been chartered to manufacture automobile devices by Robert F. Miller, Bert F. Kelley and B. E. Griffey.

LAFAYETTE, IND.—The Ross Gear & Tool Co., capitalized at $150,000, has been reorganized as the Fairfield Motor Co., and will take over the property of the Lafayette Enginering Co.

MARION, IND.—The Allmur Mfg. Co. has plans for an addition to its plant, one story, 30 x 40 feet, to cost $18,000.

PETERSBURG, IND.—The Simple Lock Rim Co., capitalized at $100,000, has been chartered to manufacture automobile rims by S. R. Clark, John L. Loveless and C. C. Walton.

PORTLAND, IND.—Sheller & Co., manufacturers of steering wheel rims, has awarded contracts for a building. The structure will give the company additional floor space of 16,000 square feet.

RICHMOND, IND.—The Richmond Piston Ring Co., Inc., has had plans prepared for a plant, to cost $40,000.

SOUTH BEND, IND.—The Studebaker Corp. has plans for 1000 houses. A subsidiary home building company has been formed with a capitalization of $1,000,000 to carry on the project.

SOUTH BEND, IND.—The Johnson Bros. Engineering Co., capitalized at $100,000, has been chartered to manufacture machinery by Louis J. Johnson, Clarence L. Johnson and Harry L. Johnson.

CINCINNATI.—The J. F. Dietz Co., 4851 Spring Grove avenue, plans a machine shop and garage, five stories, 41 x 98 feet, to cost $21,000.

CINCINNATI.—The Production Machinery Co., a new corporation which will manufacture machine tools, has leased a 3-story building here, containing 12,000 square feet of floor space.

CLEVELAND.—The Kelly Reamer Co. contemplates a plant.

CLEVELAND.—The Enamel Products Co. plans a plant, one story, 60 x 190 feet.

CLEVELAND.—The Rubay Co. will erect a plant addition, one story, 88 x 216 feet, at an estimated cost of $150,000.

CLEVELAND.—The Clark Machinery Co., 1302 Ontario street, plans a warehouse, one story, 56 x 115 feet, to cost $15,000.

CLEVELAND.—The American Stove Co. has taken out a permit to erect an addition, three stories, 60 x 152 feet, to cost $90,000.

CLEVELAND.—The Ohio Metal Utensil Co. recently was incorporated with $10,000 capital, by Jacob Hartman, E. J. Thobaben and others.

CLEVELAND.—The York-Ohio Ice Machine Co. recently was incorporated with $50,000 capital, by John Schurman, William T. O'Brien and others.

CLEVELAND.—The Magic Wall Paper Cleaning Machine Co. has been incorporated with $300,000 capital, by George J. Forcier, Melvin H. Lee and others.

CLEVELAND.—The Kulla Machine Co. recently was incorporated with $150,000 capital, by J. William Decumbe, 325 Williamson building, Michael J. Kulla and others.

CLEVELAND.—The DeMooey Electric Mfg. Co. has been incorporated with $600,000 capital, by Keith Lawrence, 329 Society for Savings building, Edward L. Neuswander and others.

CLEVELAND.—Work has started on a brass and copper smelting and refining plant, to be 150 x 300 eet, or an Ohio corporation organized by Paul E. Cleveland, Guardian building. Those interested in the project include E. T. Heinsohn, president of the United Copper Products Corp.; Ralph R. Parish, Edward A. Noll, of the National Tool Co., and Lloyd H. Pool.

COLUMBUS, O.—The Rutkowski Iron Works, 7001 Polenia avenue, will erect a factory and storage building, one story, 81 x 142 feet.

CUYAHOGA FALLS, O.—The Cornwell Quality Tool Co. has been incorporated with $50,000 capital, and will engage in business here.

ELYRIA, O.—The Standard White Metals Co. has been incorporated with $90,000 capital, by George Stevens, John K. Nece and others.

FINDLAY, O.—The Buckeye Traction Ditcher Co. is reported planning a foundry, 100 x 200 feet, to cost $75,000.

FREMONT, O.—The plant of the Hotz Foundry & Machine Co. recently was damaged by fire.

GREENVILLE, O.—The Franklin Tractor Co., of which George Hills is president, contemplates a tractor plant here.

MANSFIELD, O.—The Victor R. Browning Co. is reported planning a fabricating shop, one story, 100 x 200 feet, to cost $35,000.

NEWARK, O.—The Cree Dropped Forge Co. plans to engage in business here.

NEWARK, O.—The Moore Tool & Machine Co. has been incorporated with $250,000 capital, by Otto N. Moore, E. D. Leach and others.

SPRINGFIELD, O.—The Springfield Machine Tool Co. plans a plant, one story, 50 x 60 feet, to cost $15,000.

TOLEDO, O.—The Kasle Iron & Metal Co., 1212 Elm street, contemplates erecting a smelting plant.

TOLEDO, O.—The Toledo Enameled Wire Products Co. has been incorporated with $300,000 capital, by Seymour Hirsch, George R. Beckwith and others.

YOUNGSTOWN, O.—Ground will be broken shortly for additional buildings at the plant of the Truscon Steel Co.

LOUISVILLE, KY.—The Standard Sanitary Mfg. Co. will erect a foundry, 70 x 85 feet, at an estimated cost of $75,000.

DUNBAR, W. VA.—The Dunbar Flint Glass Co. will make additions.

GRAFTON, W. VA.—The Southern Glass Co. has been organized with Wm. G. Hammond, manager, and will build a plant.

HUNTINGTON, W. VA.—The Virginia Glass Mfg. Co. will build a plant.

New Trade Publications

AIR TOOLS.—Pneumatic tools, consisting of hammers, holder-ons, drills, grinders, rammers, etc., are described in a leaflet recently published by the Independent Pneumatic Tool Co., Chicago.

ARC WELDING.—The U. S. Light & Heat Corp., Niagara Falls, N. Y., is circulating bulletin No. 700, in which electric arc-welding equipment is described and illustrated. The booklet also contains a number of characteristic curves.

THREAD MILLER.—The Smalley General Co., Inc., Bay City, Mich., has published a 4-page leaflet, containing data on a thread miller which it manufactures. The leaflet contains a number of illustrations, including a chart, which gives the necessary data for milling work under any condition of feeds and speeds with a miller, of either the motor or belt-driven type.

SLAG LINE COOLERS.—Savings in upkeep and operation of open-hearth furnaces and profits from increased capacity as a result of using the slag line cooler are set forth in a 16-page booklet issued by the Open Hearth Steel Furnace Co., Chicago. The device has been described previously in these columns. The pamphlet is embellished by drawings and photographs of installations and, figures based on actual operation over a certain period are given.

THAWING OUTFIT.—The Aeroil Burner Co., Inc., Union Hill, N. J., is circulating an 8-page folder, in which an outfit for removing ice and snow from frozen coal, sand, ore cars, hoppers, pockets, conveyors, leading chutes, dipples, tracks and switches, etc. The outfit consists of a pressure tank of 10 gallons capacity, a powerful hand power air pump, flexible hose, fittings, etc., and two kerosene thawing burners. According to the folder the average consumption of each burner is two gallons an hour.

MAGNESITE.—The Northwest Magnesite Co., Chewelah, Wash., has published an illustrated booklet containing information of the company's history, the manufacture of magnesite, its use and the company's properties. The first section of the booklet gives the history of the company. The second section describes the company's plant and deposit, and a third section is devoted to describing methods for miscroscopic examination, which is accompanied by a number of colored plates, illustrating magnified sections of magnesite brick.

HIGH SPEED STEEL.—The Onondaga Steel Co., Syracuse, N. Y., has issued a new catalog bearing the title, "Intensive Specialization." One section of the booklet contains an article on "Steel Conservation," and another section an article on "Selecting of High Speed Steel Scrap," in which a short description of the method of testing high speed steel scrap by the emery wheel spark is given. The booklet contains tables of sizes, weights of high speed steel bars, giving the millimeters and kilograms in red, and inches and pounds in black. The booklet also contains directions for the treatment of high speed steel, and contains a color chart which gives an idea of the various heats required. It is illustrated.

THE IRON TRADE REVIEW

Vol. LXV Cleveland, December 25, 1919 No. 26

Makers Carry Over Big Tonnage

Obligations of Mills and Furnaces at Year End Greatly Swollen Because of Production Lost by Strikes—Market Much Congested and Prices Show Great Strength—Allotment of Tonnage in First Half Necessitated

CONFRONTED by a loss of production reaching several million tons because of the steel and coal strikes, iron and steel manufacturers are closing the year with a great tonnage of deferred obligations and with order books unduly swollen. Of the large volume of business on hand the carry-over from that originally accepted for 1919 delivery constitutes an important part and this must be satisfied out of 1920 output. Moreover the regular requirements of many consumers for the first quarter and first half entered by the producers during the past month or two in a number of lines are unusually heavy. With plant operations still backward, a congestion of business has followed which forbids the taking on of further obligations and spells continued disappointment to urgent buyers who fill the market.

Those steel products in which the situation is tightest are sheets, tin plate, steel bars, strip steel, wire and oil and gas pipe. In some of these lines pro-rata allotments among consumers will be necessitated. Unfilled sheet bookings in December were estimated at over 1,000,000 tons. In tin plate 400,000 tons of orders will be carried over into next year. Steel bar capacity promises to be filled for three to six months. The leading interest is reported to be sold up on oil country pipe through practically all of next year. It has become a serious question how some prospective demands are to be satisfied. The automobile industry with increased production schedules for 1920 in view is a case in point. The requirements of rim stock of the Ford Motor Co. alone are placed at 150,000 tons.

Prices Are Strong

The effect of these conditions is to stimulate the naming of higher prices. The spread between the minimum figures which the Steel corporation and other interests following a strongly conservative policy are quoting and those being realized by various mills, continues to grow. One independent maker of wire products has opened his books to January tonnage on the basis of 4.25c on nails or $15 per ton above the market's minimum. Steel bars continue to sell up to 3.50c Pittsburgh. Eastern plate mills are booking first quarter contracts at 3.00c to 3.25c, Pittsburgh. Eastern shapemakers are turning away business at attractive prices. In northern Ohio, round tonnages of slabs and sheet bars for first quarter have been entered at $50 and $51 respectively.

British Steel Is Sought

The excess of sheet demand over supply is reflected by American inquiries for 7000 tons of galvanized which have appeared in the British market. British mills are equally overwhelmed with business in this product, however, and can make no deliveries until summer. Prices on various iron and steel materials continue to rise in Great Britain according to the weekly staff cable of THE IRON TRADE REVIEW, especially in semifinished steel, sheets, tin plate, structural shapes and bars. Welsh tin plate makers are swamped with world-wide inquiry for tin plate, the same as the mills in this country. One inquiry from the Orient calls for 160,000 boxes.

Germany is believed to have taken an order for 25,000 tons of cast iron pipe for Java and the Dutch East Indies which had been offered to American foundries. Brazil also has opened negotiations in this country for 25,000 tons of cast iron pipe.

Iron Supply Inadequate

Pig iron prices have gone higher in some districts but on the whole the market is steadier. A range of $38 to $40 for the base grade of foundry iron is representative for most producing centers. In the south, sales have been made at $36 Birmingham, and more has been quoted. Eastern basic was sold in the week at $39 furnace. This grade is scarce and there are many buyers in the market, including 30,000 tons for a large steel foundry interest. The demand for iron continues greater than that available for sale. The straitened position of the furnaces on supplies is being prolonged by the shortage of coke which is affecting operations.

The Steel corporation has closed for 12,000 tons of 50 per cent ferrosilicon to cover its 1920 requirements. English ferromanganese for second and third quarter has been sold at $130 tidewater.

Are Visitors Playing Fair?

SINCE the war the number of manufacturers and engineers who are visiting the plants of their competitors in foreign countries has increased surprisingly. In many of the larger blast furnace and steel plants it is not uncommon for works superintendents to receive dozens of requests daily for permission to inspect their equipment and operations.

In most cases these requests have been granted and few, if any, visitors from foreign shores have been denied entrance to mills because of their nationality. Within the past few months, however, there has been a growing attitude of reserve toward a certain prevalent type of alien whose visits are marked by demands for voluminous information regarding the innermost details of operation. American plant officials have been reluctant to withhold from visitors of this type the courtesies extended to others, but unfortunately their action has been forced by the visitors themselves.

When foreign representatives first came to the United States to investigate steel works, they were extended every possible opportunity to become familiar with American practice. After several years of this open-door policy, American engineers began to seek entrance to plants of some of the foreign manufacturers whose countrymen previously had enjoyed this privilege in the United States. To their surprise, admission was refused. This is not an isolated case but on the contrary it coincides with the complaints frequently made by American travelers abroad. As a result of this failure to reciprocate, many American manufacturers are becoming more reluctant to allow visitors from these countries to enter their plants.

If some of the foreigners now visiting in the United States find it increasingly difficult to gain admission to industrial plants they may attribute this seeming act of discourtesy to the narrow-minded attitude of their countrymen at home. Men identified with the iron and steel industry in England and the United States have been unusually liberal in their dealings with visitors from other countries, and naturally they have the right to expect that similar treatment will be accorded their representatives abroad. The unreciprocating attitude, so apt to be interpreted by fair minded British and American business men to be based on the axiom "Take all but give nothing in return," cannot possibly lead to gain. On the other hand, it may develop distrust and antagonism which will go far toward discounting the beneficial results of present industrial and commercial awakening.

Eliminating Politics From Strikes

SUPERSEDING by its general importances, any restricted application to local conditions, a decision handed down by Judge Westenhaver of the United States district court at Cleveland recently, is a notable addition to the court decrees pertaining to the legal powers of civic authorities in labor disputes. This decision in effect completely overruled the position pursued for several months by the mayor and his chief of police in barring from the city of Cleveland, workmen from outside points who had applied for jobs or who had been brought in by various companies during the steel strike. Hundreds of workmen, many of them American citizens, and in the full possession of their rights as such, have been seized and deported from the city due to this policy. This has been a leading factor in the slow restoration of the iron and steel production in Cleveland following the breaking up of the strike. The flagrantly, unfair attitude pursued by the city administration toward the iron and steel employers of Cleveland manifestly has been due to political motives and has been carried out under the thin pretense of the enforcement of the "suspicious person" ordnance. Any strike breaker was deemed to come within the provisions of this ordnance.

Judge Westenhaver in his decision declared that the so-called "suspicious person" ordnance under the circumstances had been illegally applied and he issued

an injunction to the plaintiff restraining Mayor Davis and Chief of Police Smith from interfering with the efforts of the plaintiff, the American Steel & Wire Co. to recruit its labor forces where it chose. In this ruling the court said:

"That plaintiff is entitled to relief by injunction in this situation is obvious from a consideration of well settled legal principles. It is engaged in a lawful business and has a right to conduct that business without unlawful interference, either by its striking employes or by any other persons. It may solicit and procure persons to work in its plant, no matter where they reside, or whether citizens of the United States or not. No one may lawfully interfere with this right of plaintiff, and if deprived thereof its property is destroyed.

"This is also equally true of all persons desiring to enter into the employment of plaintiff. To deny any such person that right because he does not live in Cleveland would be to abridge or deny to such person privileges and immunities belonging to every citizen of the United States and protected by its constitution from a denial or abridgment by any state. The protection accorded by the constitution of Ohio is equally sweeping. The power to preserve the public peace and to arrest and prosecute persons for crime cannot be made to support action depriving persons of these constitutional rights and privileges."

Votes and mere numbers at that, too often play their part in the local enforcement of law and order or lack of it in labor disputes. The well-merited rebuke administered by the federal court to the mayor of Cleveland and his subordinates is bound to have a good moral effect, not confined to the iron and steel industry. It not only clarifies the legal rights of employers in an important respect but it serves to arouse the consciousness of the workmen as to what the badge of American citizenship really implies.

Secretary Lane to Leave

GENERAL regret is felt by the country that Secretary of the Interior Franklin K. Lane has decided to leave the cabinet of the present administration. Conceded to be probably the ablest department head in the administration, his departure will be a real loss. His constructive ability shown as a member of the interstate commerce commission has been further signified throughout his tenure as secretary of the interior. Broad-visioned, Secretary Lane always has shown a comprehensive grasp of the big internal problems of the country. He has been a strong influence in solving some of them, and in making practical recommendations for the solution of others. Apparently and unfortunately, his advice has been neither courted nor accepted by the administration during the past two years and it is not improbable that this fact has helped to influence Mr. Lane to leave the cabinet. His dignity and regard for the President, however, has restrained him from airing any grievances he may have had. Instead he now has issued a frank, moderate statement, explaining briefly that because of the illness of the President he had not as yet sent in his resignation.

If, as reported, Secretary Lane's decision to leave the cabinet is attributed in part to his inability to conscientiously agree with the President's policy in "settling" the coal strike, his attitude coincides with that of many others who think the administration has yielded without justification to organized labor. But no one who knows Secretary Lane or his policies can charge him with being unfair to labor, either organized or unorganized. He has been honest and just to both, as he has been fair to the business interests of the country. In his differences with Secretary of War Baker and apparently the President over the prices of coal he proposed when the United States entered the war, public sentiment generally approved of his position, although it was overridden by the administration. Various subsequent policies of the administration appear to have been adopted without due consideration to suggestions which he had made. Under such conditions it is easy to understand why Secretary Lane has decided to resign although his act must be a source of great regret.

Japan Wins Chinese Trade

AN AMERICAN banking institution with close connections in the Orient recently has made a very interesting report with regard to business conditions in the Far East. With respect to China the report says:

"A noticeable feature of China's general trade during the past year is the increased share secured by Japan, whose merchants now buy much of the raw material exported from China and furnish that country with a large proportion of its need for staple products."

This report discloses nothing new to those American exporters who have been closely interested in the Oriental trade. Repeatedly it has been noted in that quarter that the Japanese have been heavy speculators in iron and steel commodities. On the other hand the Chinaman is not a speculator. He buys only when he actually needs the material. Under such circumstances it is not unreasonable to expect that a great share of the goods bought by Japan have been intended for resale to the Chinese.

In this way the Jap is enhancing his dominance in the Far East. There appears to be but one way for Americans to gain a foothold in China in metals, and that is by direct representation. It means that American exporters must keep themselves better posted on Occidental politics and society if they would build for permanency in trade and properly safeguard their interests in the future.

Basic Iron Sells High in the East

Tonnage Booked at $39 Furnace and $3 Over Previous Transaction—Eastern No. 2X Bringing $40 to $44 Furnace—Shortage of Cars and Coke Continue to Affect Production and Deliveries—Demand Exceeds Supply

Pittsburgh, Dec. 23.—Though still inclined to a lag behind other districts in the matter of prices, the pig iron market here shows evidence of great strength. Proof of this is found in a sale of 500 tons of No. 2 foundry for prompt shipment at $40, valley furnace basis, and the fact that while no round tonnages have been moved at that figure, none of the blast furnace interests who have any unsold tonnage for either prompt or first half shipment will consider less than that price. Sizable tonnages of standard basic have been sold within the week under review, at $35, valley furnace and a considerable amount of bessemer has been moved at $37, valley furnace, though no individual sales of as much as 1000 tons have been made at that figure. For round tonnages of basic the market still is quotable at $35, furnace, though it is asserted that this price has been offered for some off-iron running high in silicon and off in sulphur, while some makers expecting higher prices are disinclined to consider any business at the moment. Merchant producers are well sold ahead on foundry iron, but 1920 bookings for steel making grades have been moderate thus far and have been confined largely to the first quarter, though as a result of the contraction in blast furnace operation due to the coke scarcity, not a little first quarter tonnage is likely to become a second quarter obligation. This is true of merchant production generally and constitutes one of the strong elements of the situation in that the shortage which now exists is not probable of relief until well after the turn of the year. A number of blast furnaces which are ready to be lighted remain idle because coke is unobtainable, while here and there some have been forced to bank and others will have to do so soon unless the production and shipment of coke shows a decided increase. Malleable iron for first half of 1920 shipment was done at $38.25, valley furnace, recently, but there also have been sales of this grade to brokers around $36, valley furnace.

Upward Trend Not Checked

New York, Dec. 22.—Despite the disposition on the part of some furnaces which has been noticed recently to discourage sharp price advances, the upward trend of pig iron prices in this district is just as pronounced as before, and, although there now is a slight lull in demand in anticipation of the holidays, a comparatively heavy volume of business has been booked here during the past week. While some foundry iron still was being entered a week ago for first half at $39, eastern Pennsylvania furnace, for 2.25 to 2.75 silicon, this figure now has disappeared, and the minimum on this grade for any delivery seems to be $40, eastern Pennsylvania furnace. In fact, the general market on this grade for first half now may be represented by a spread of $40 to $42, eastern Pennsylvania furnace for this grade. On a number of instances, sales of small spot tonnages have been made at $43 and even $44, eastern Pennsylvania furnace, for 2.25 to 2.75 silicon. The latter prices, however, still are exceptional. Some Virginia iron has been sold in this district during the past week at $42, furnace, for 2.75 to 3.25 silicon. Good-sized lots of central Pennsylvania foundry for first half have been sold at $41 for 2.25 to 2.75 silicon, and $42 now is being asked. Buffalo foundry has been sold at resale for prompt shipment during the past week at $41, Buffalo, and even higher for 2.25 to 2.75 silicon.

Strong Demand at Buffalo

Buffalo, Dec. 23.—A strong demand for first half iron in this district is going unsatisfied. Business is not as brisk as it was, because consumers realize that furnaces have almost exhausted their first half capacity, but after the holidays, it is believed, business will assume still larger proportions. The stringency is made more emphatic by the fact that one of the producing interests in this district, which has been out of the market for considerable time, has been forced to keep three stacks out of blast because of the shortage of coke. Only one furnace in this district is at liberty to take first half iron. This producing interest has raised its prices, and authorizes this schedule for the three grades of foundry: No. 2 plain (1.75 to 2.25 silicon), $40; No. 2X (2.25 to 2.75 silicon), $41.25; No. 1X (2.75 to 3.25 silicon), $43. Representatives of this furnace state that small tonnages have been sold during the past week at these prices. Third quarter iron is not for sale. One other furnace that sold a small tonnage of No. 1X during the past week, received $41 for foundry and $39.25 for malleable.

Little Iron for Sale

Cleveland, Dec. 23.—A heavy inquiry but few sales covers the pig iron market in this district. Buyers continue much more active to place tonnage than producers are willing or able to accept. One Cleveland producer in the week sold some tonnage of No. 2 foundry, 1.75 to 2.25 silicon,

at $38, furnace, and this apparently represents the present market level locally. Other makers in northern Ohio or valley territory have made further sales in the week at $38, furnace, for No. 2 foundry, and $39.25 for 2.25 to 2.75 silicon. A sale of 500 tons of malleable for first quarter at $38, valley, is noted. Consumers in Detroit territory remain in the market with a heavy unfilled requirement. One large buyer there recently closed for 7000 tons of foundry. Brokers have made a number of sales in Detroit and Cleveland territory and have been trying to arrange with certain furnaces for substitutions of orders which will enable them to fill these obligations. It has been estimated by one furnace interest that recent inquiries, a large part of which are from brokers, have totaled 50,000 tons. Basic remains scarce and there is a receptive demand among northern and southern Ohio steelmakers for a large tonnage. One northern Ohio interest has been figuring on 15,000 tons, a southern Ohio user has renewed a request in which 4000 to 5000 tons now is named and there are other buying propositions in sight. The McKinney Steel Co. has blown in an additional furnace in this city and now has three of its four stacks in blast.

Car Shortage Delays Iron

Chicago, Dec. 23.—Inability of pig iron producers to obtain more than a small fraction of the car supply needed to move their produce is resulting in most of the iron now being produced being piled on furnace yards. This is a result of the order limiting the use of open cars to the coal trade. However, a few cars are furnished occasionally and thus some shipments are possible, while the bulk of the iron cannot be moved. Local iron, when it can be obtained at all, is quoted at $40, furnace, for foundry iron containing silicon 1.75 to 2.25 and $40.50, furnace, for malleable. The leading producer is selling only small lots of prompt iron to regular customers. Some tonnage is being contracted for first quarter delivery at the same price by another producer, being sold against the production of a stack which is idle at present. The total tonnage available from this source is probably 5000 to 7000 tons. One southern producer is selling a small tonnage of prompt iron at $36, Birmingham, for silicon 1.75 to 2.25, but no southern maker is making contracts for future delivery, as far as is known. Another southern interest is offering a small tonnage of 4 to 7 per cent silicon on the basis of $36, Birmingham, for the base grade. Inquiry is strong, a Chicago manufacturer of machinery seeking 1500 tons of malleable for first half. The Chicago, Milwaukee & St. Paul railroad is in the market for 3000 to 4000 tons of foundry and charcoal iron. The largest inquiry now current involves 30,000 tons of basic iron for a consumer with plants located both east and west. Competent observers believe it will be difficult to cover any important part of this tonnage. Other inquiries include 2000 tons of foundry iron for a Michigan melter, 1000 tons of low phosphorus for Chicago delivery and 2000 tons of malleable for a Chicago user.

Little Metal for Sale

Cincinnati, Dec. 22.—The pig iron market in this district appears to be nearly at a standstill because of excessively low stocks, although there is an urgent buying demand. Some consumers have made almost frenzied efforts to obtain supplies during the past week. Prices are strong and show an advancing tendency under the persistent call of buyers, and a generally higher schedule is confidently predicted in all quarters for delivery early next year when supplies are available. In the Ironton district there is absolutely no iron and quotable prices have bounded upward, there being bids up to $41 for delivery early in the first quarter of 1920. Practically the same condition prevails at Birmingham, where the furnaces are out of the market. There is a continued scarcity of coal and coke. Southern producers report urgent inquiries.

Sales Light, But Demand is Active

St. Louis, Dec. 20.—Selling of pig iron during the week has been in light volume relatively, but the demand is still broad and active. Nothing is offered for prompt shipment, little for the first quarter, and less for the second quarter of 1920. While southern interests have not sold out their entire capacity, they are endeavoring to determine production costs for next year before opening their books for disposal of their remaining tonnage. Consumers are eager to obtain deliveries on contracts. The coal situation in this district is rapidly clearing up. Several southern furnaces now idle are preparing to go into blast. Foundry iron is stronger than steelmaking grades, because of the almost unprecedented activity of foundries. Selling agencies representing eastern and northern furnaces report iron is growing scarcer. Some of the smaller plants in this district which have delayed covering their requirements, will be unable to operate fully unless they obtain iron. Some relief may come later with the resumption of production by certain furnaces, but even they have sold against anticipated production, as in the case of the Mississippi Valley Iron Co., which will not resume until March, but which recently sold 10,000 tons of basic to the Scullin Steel Co. Sales of identical grades have been reported at different figures. Southern foundry (1.75 to 2.25 silicon) is being offered by makers at $40, but no sales at that figure have been reported. One dealer was offering small tonnages of northern iron (1.75 to 2.25 silicon) at $40, Chicago, for delivery in February and March.

Anxious to Place Business

Birmingham, Ala., Dec. 23.—Inquiries for pig iron are numerous, and consumers are anxious to have their business accepted. One of the smaller companies in this district tried out the market a few days ago, offering a little spot iron at $1 above the quotations then in effect, and the tonnage was quickly taken. There is a tendency on the part of producers to remain out of the market for the present. Sales have been made on a basis of $36 for No. 2 foundry (1.75 to 2.25 silicon), and the report is that $38 can be obtained. Little iron for first quarter is available, while not more than half of that of the second quarter has been disposed of. The Hattie furnace of the Sloss-Sheffield Steel & Iron Co., at Sheffield, is making iron again, and No. 3 furnace of the same company, at North Birmingham, will be ready for operation by March 1. A skip hoist, cast shed and crane are being built at the plant. Shipment of iron from the Birmingham district is restricted by lack of cars.

Basic Has Sharp Rise

Philadelphia, Dec. 23.—After several weeks, basic in this territory again has advanced sensationally. A sale of several thousand tons has been made for first quarter at $39 eastern Pennsylvania furnace. Prior to this sale the market on this grade had not been considered so high; in fact it is not yet certain that less could not be done. A Cumberland, Md., consumer is inquiring for a round lot of basic for first quarter. Several thousand tons of standard low phosphorus iron has been sold for first quarter at $46 eastern furnace equivalent to $49.80 Philadelphia. Small sales of copper-bearing low phosphorus have been closed at $41 furnace but it is not yet certain that the $40 price has disappeared. From 6000 to 7000 tons of gray forge sold for first quarter have been sold at $38 to $39, eastern Pennsylvania furnace and a big inquiry is unsatisfied because of the lack of this grade. Malleable in substantial tonnages has brought $39 eastern Pennsylvania furnace and $40 now is being asked. The last price on charcoal iron quoted to this district was $50 Michigan furnace but this now is withdrawn. There has been some round lot business in bessemer and this grade now is around $38 valley equivalent to $42.40, Philadelphia. Altogether the past week was characterized by a large total of pig iron business in which both furnaces and second hands figured actively. A large business was done in foundry iron at prices ranging $40 to $44 eastern Pennsylvania furnace for No. 2X (2.25 to 2.75 silicon) with the inside price now exceptional. Central Pennsylvania furnaces here sold heavily at prices ranging from $40 to $41 furnace for No. 2X. Differentials in most cases for No. 2 plain (1.75 to 2.25 silicon) and No. 1X (2.75 to 3.25 silicon) are $1 but one furnace which has sold considerable No. 1X now is asking differential of $1.75 for the latter. Buffalo foundry for first quarter and second half has been sold by makers at $40 and $41, Buffalo, for No. 2 plain. All Virginia makers with one exception now holding at $40 furnace for No. 2 plain, $41.25 for No. 2X and $43 for No. 1X and sales have been made on this basis. Some Virginia iron still is obtainable on the basis of $38 furnace for No. 2 plain. A Lynchburg pipemaker bought heavily of No. 2 plain and practically cleaned up the tonnage, to be made for the first quarter.

The Midvale Steel & Ordnance Co. is making low phosphorus iron at its

furnaces at Coatesville and will run on this grade for about a month.

Must Buy Additional Tonnage

Boston, Dec. 22.—The holiday quietness is apparent in the pig iron market in spite of the fact that many foundries are still anxious about their supplies for first half. It is estimated by those in close touch with the New England situation that foundries have already purchased approximately 75 per cent of the iron which they will require up to June, 1920. Because the furnaces are behind on 1919 deliveries new purchases will have to be made during the early part of the year covering nearly 50 per cent of needs, or, conservatively speaking, about 100,000 tons. The furnaces which usually supply the New England trade are for the most part sold up. Southern furnaces still have considerable tonnage to offer. The Virginia furnaces are rather heavily sold. The eastern Pennsylvania furnaces have comparatively little iron to offer, for first quarter. Most consumers have decided to hold up their purchases until after the inventory at the first of the year. The sales during the past week in Boston have been unusually small. One southern furnace sold 300 tons of a special analysis iron to a Massachusetts consumer at a $36.00 base, Birmingham. Small sales of Virginia iron were made on a $38.00 base, furnace, but some sales have been at a higher figure and the market is generally considered to be above this level. In eastern Pennsylvania sales have shown a wide spread. A sale of 400 tons was made at $41.25, furnace, for 2.25 to 2.75 silicon, and others are reported as high as $44.00, furnace. Resale iron is bringing $45.00 and $46.00, delivered, New England points. Deliveries of pig iron are slowing up due partly to a car shortage.

Car Shortage

Holds Up Tin Plate Shipments—Production On the Upgrade

Pittsburgh, Dec. 23.—With improvement in the coal situation, tin plate mill activities are on a larger scale. While production is gaining steadily and is being applied largely to existing contracts, a shortage of cars has been holding up shipments and this situation has rather intensified the demand for prompt or early delivery. The American Sheet & Tin Plate Co., at one of its valley plants last week piled up no less than 75 carloads of finished material because of inability to obtain cars. Almost no tonnage beyond contract obligations is available for first quarter shipment, and prompt business cannot be taken on except at the expense of old orders. While some business has been taken for that period at $7.50 per base box, Pittsburgh, and it is reported that as high as $9 was quoted against an inquiry for 20,000 boxes for that delivery, makers generally are quoting $7 per base box, Pittsburgh, to regular customers. Substantially higher prices are quoted on export inquiries, and domestic buyers without regular supply sources also are being asked more than the regular market base.

Coke Situation Still Tight

Car Shortage Offsets Any Advantages Resulting From Lifting of Government Restrictions—Merchant Producers Suffering the Most

Pittsburgh, Dec. 23.—A shortage of cars has more than offset any benefit expected from the lifting of the fuel administration's restrictions on production of beehive coke. While production in the Connellsville regions in the week ended Dec. 13, fell off less than 30 per cent compared with the previous week, the merchant ovens suffered considerably more than that. Last week their loss was more pronounced, due to the fact that only 30 per cent of the car supply was allotted for coke shipments. At some plants the number of cars was but 10 per cent of the requirement, and the situation is no better this week. Oven operators are endeavoring to meet their contract obligations to the exclusion of spot demands, but are not succeeding, as a couple of valley merchant stacks have been forced to bank because of the lack of coke, and others are expected to go down unless immediate relief is forthcoming. Meanwhile, coke is eagerly snapped up by the steel companies unable to get sufficient coal to operate their by-product plants.

Some reports have been current that the fuel administration never restored officially the old government maximums on coke. The order was signed by Dr. Garfield, but was not sent to the operators. This, however, was not necessary. Removal of the price restrictions cannot be expected until the by-product plants get normal coal supplies, and when this will be is merely a matter of conjecture. Little, if any coke, is available at the fixed prices.

It is stated that several offers of $6, ovens, for furnace coke have been refused by oven operators, who claim they can obtain $8, $9 or $10, ovens, from the steel companies. In view of the fact that operators are unable to meet their contract obligations, considerable business is piling up, and this must be taken care of before much coke will be available for the open market. Not much has been done lately in the matter of contracts and consummation of pending negotiations probably will be deferred until the price restrictions are removed. It is believed that fully 70 per cent of the production in the Connellsville regions for the first half of 1920 is under contract or reservation. Fixed price contracts have carried prices of from $5.50 to $6, ovens, while on sliding scale agreements, ratios of from 5½ to 4½ to 1 on valley basic pig iron, have been accepted by consumers. On $35 iron, coke under sliding scale contracts has a value of from $6.35 to $7.75.

Many foundries in this district appear to be better off in the matter of coke supplies than the blast furnaces, possibly because of restricted cupola operations, due to the scarcity of iron. Connellsville production of coke for the week ended Dec. 13, is estimated by *The Connellsville Courier* to have been 191,600 tons, as compared with 262,810 tons in the previous week.

Approach of Holidays Brings Lull

New York, Dec. 22.—Coke buying has fallen off in volume in this district due to the approach of the holidays. Restoration of government prices and the resumption of coal production also have tended to terminate the period during which consumers were anxious as to their situation with respect to supplies and prices of fuel. The northern New Jersey by-product producer continues to quote $7.50 Connellsville, for by-product foundry coke for spot and first half delivery. It continues to book orders for by-product furnace coke at $8.69 ovens, for spot shipment. The beehive makers, generally, are not offering.

Producers Well Sold Up

St. Louis, Dec. 30.—Demand for coke is active. Ovens supplying this district seem well sold up and regular customers are receiving scarcely enough to fill their requirements. It is hoped, however, that lifting of government restrictions on the manufacture of coke will result in more liberal offerings early in 1920.

Foundries are busy and demand from that source is continuous. Smelters also are inquiring for more coke. Southern makers are not offering a pound of coke in this region, and latest advices indicate they will not do so for at least six months. Numerous inquiries arrive daily from the West and Southwest.

Production Improving in South

Birmingham, Ala., Dec. 23.—Beehive ovens in Alabama are producing normally, while by-product plants have continued operations. Demand for coke is increasing, but producers apparently are not yet ready to take on new business. Independent companies are shipping coke to the West and into Mexico. Quotations are unchanged, $9.50 being the price for foundry coke and $7.50 for furnace.

Turn to By-Product Fuel

Boston, Dec. 22,—Most New England consumers of foundry coke have contracted for their first half requirements based on their present rate of production. At present there is a decided lull of business especially as to prompt deliveries. A feature of the by-product market in New England is the demand from foundries in New York and Canada. Failing to get sufficient Connellsville coke, foundries in the Buffalo district have turned to the by-product producers along the Atlantic coast and many substantial orders have been placed during the last two weeks. The low Connellsville price has made the sliding scale contracts, which heretofore have been based on the beehive prices, unpopular with the New England producers.

Scrap Market is Firmer

Resumption of Various Plants After Coal Shortage Stirs New Demand — Some Grades Again Advance

FOR COMPLETE SCRAP PRICES SEE PAGE 1744

St. Louis, Dec. 20.—The market for scrap iron and steel continues on the upgrade. Sentiment among dealers and even consumers is bullish, induced by a broad and active demand, and marked scarcity of all grades. The railroads had no lists before the market this week, and aside from a few scattered cars disposed of at private sale the carriers offered nothing. Little material is coming in from the country. Rolling mills are endeavoring to purchase sizable tonnages, believing that by the end of next week they will be able to procure all the coal they need. The Helmbacher plant of the American Car & Foundry Co., which is the largest single user here, is understood to have bought 5999 tons this week. The St. Louis Screw Co. is in the market for supplies. Dealers report numerous inquiries from outside points, many of which are never heard from in this market unless there is a general scarcity. Eastern interests are buying, and industries between here and Chicago apparently have need of large supplies. The feature of the week's business was the sharp upward revisions in dealers' lists. Virtually all quotations were advanced, changes ranging from $1 to $3.50. The heaviest rise was in old car wheels, which are up $3.50 to $28.50 to $29. Heavy melting steel was marked up to $24.50 to $25, with shoveling steel proportionately higher. Agricultural malleable was advanced $2 and stove plate $1.50. Cast grades of all descriptions are most in demand, and are scarce.

Cast Scrap Snapped Up

New York, Dec. 21.—Heavy demand for cast scrap continues to shoot prices upward. No. 1 heavy machinery cast is now quoted at $27 to $28, f.o.b. New York, and machinery cast at $29 to $30. Foundries are closing on practically every tonnage offered at the current market. Grate bars also are being bought in better volume, and at advancing prices. This material is now holding at $19.50 to $20 f.o.b. New York. Other descriptions to advance are city wrought pipe, long stock, holding at $21.50 to $22.50, f.o.b. New York, and railroad wrought, being offered at $27.50 to $28. The upward tendency in these materials appears to be due more to scarcity and the general strength of the scrap market than to the volume of demand. Heavy melting steel is strong, but unchanged.

Steel Companies Are Buyers

Philadelphia, Dec. 23.—The Bethlehem Steel Co. has bought a large tonnage of heavy steel scrap at $22 delivered which generally is regarded as below the market. This interest also bought a large tonnage of blast furnace borings and turnings at $17.25 to $18 delivered. The Phoenix Iron Works bought 2500 tons of machine shop turnings at $17 delivered. The turnings market is easier while borings continue strong. A sale of rerolling rails was made at $34 delivered. Foundry scrap is strong but erratic. Sales of No. 1 cupola have been made at $32 to $35 delivered.

Prices Already Are Firmer

Pittsburgh, Dec. 23.—Demand for scrap is more active demand and dealers are now giving little consideration to bids they would have accepted a week ago. Heavy melting steel has moved up to $25, delivered, and some has been sold at that price to steel manufacturers in the Pittsburgh and Wheeling districts. Less than that now will not be considered by dealers, most of whom believe that prices will advance. Grades finding the same use as heavy melting steel are sympathetically firmer, and it is wasted effort for buyers of foundry grades to attempt to obtain supplies at recent prices. Low phosphorus steel is not obtainable now for less than $30, delivered. Machine shop turnings, which consumers could not be interested in at $15, now are held at $16. Pressure to sell bundled sheet sides and ends has abated with the improvement in the prospect, while knuckles, couplers and springs instead of selling at parity with heavy melting grade now are at a premium over that grade.

Trading at Buffalo Light

Buffalo, Dec. 22.—All grades of scrap in this district have been advanced, but the prices are only nominal as trading is light, and it is impossible to buy a large tonnage of any grade. All the mills tentatively are in the market but are not pressing forward for material. Dealers believe the first of the year will see a general increase in prices, as by that time mills will know how much scrap they will be able to use.

Southern Market Firm

Birmingham, Ala., Dec. 23.—The scrap iron and steel market in the South is not weakening. Dealers are showing confidence and contracts are being accepted. Some apprehension is felt that if too large a tonnage is sold for future delivery there may be some difficulty in obtaining sufficient material to fill them. No change has been made in prices, although they are showing an upward trend. Cast scrap is less plentiful. Consumers of heavy melting steel still are hesitating as to paying prices asked by dealers.

Chicago Market Holds Strength

Chicago, Dec. 23.—Firmness characterizes the market for scrap iron and steel in Chicago, a recent purchase of a round tonnage by an open-hearth consumer outside Chicago having given the market a decided upward turn. Resumption of production by bar iron mills has given wrought scrap and busheling an upward tendency, while continued demand for cast scrap is making those grades advance steadily. Increasing activity of steel plants is giving grades which go into open hearths a much livelier feeling. Railroads are offering comparatively little, the list of the Rock Island, offering 1200 tons, being the only one out at present.

Cast Leads the Market

Boston, Dec. 22.—Cast scrap iron continues to advance in price and there is no let up in the demand from foundries for better grades. A lot of 500 tons of mixed railroad and machinery scrap was sold to an eastern Massachusetts consumer during the week for $36.50 and some smaller sales have been made at even higher figures. The demand for turnings which fell off last week still is quiet although one sale of approximately 2000 tons to a Pennsylvania steel plant has been reported. Heavy melting steel scrap also is quiet. Although some sales continue to be made for delivery to Pennsylvania, the prices remain unchanged and the demand is not active. Most grades of scrap with the exception of machinery cast are quiet. The salvage board continues to bring out small lots of steel and wire scrap and 4,500,000 feet of steel cable located at Worcester, Mass., is among the recent offerings.

Trading Confined to Dealers

Cleveland, Dec. 23.—The scrap iron and steel market in Cleveland just now is wholly a dealers' affair. Some dealers are speculating and offering several dollars more than the market; others are bearish and refuse either to sell or buy until the price trend can be determined. Larger melters of scrap, barring the foundries, say they will not need a pound before March 1. Some dealers explain the unusually wide spread between pig iron and heavy melting steel to the fact that scrap is plentiful, while the reverse is true of pig iron. Trading in the past week has been confined to small lots among dealers and some speculative buying on a small scale. Prices are unchanged.

Pressing Needs

Still Receive Exclusive Attention of Pipe Mills—Fancy Prices Paid

Pittsburgh, Dec. 23.—While all makers of pipe in this, the valley and Wheeling districts have increased operations as a result of the easier fuel situation, production has not risen to a point where any of them has abandoned entirely the recent practice of confining activity to most pressing needs. Makers are going over their order books carefully and then asking buyers to specify minimum tonnages necessary. Total bookings are not being rapidly reduced by this plan. None of the manufacturers can guarantee shipments of oil country pipe before the second quarter, while the leading interest is sold prac-

tically through the entire year. Some fancy prices are being offered for oil well pipe for early delivery. A buyer in McKeesport paid $2.40 per foot for some secondhand 6-inch, 24-pound casings, against the list price on new pipe of this size and weight of less than $1.30 per foot. Drill, drive and line pipe and casings, it is said, would bring about double the present schedules for early deliveries if makers could accept the business. Jobbers are down to bare boards on merchant pipe in both steel and wrought iron.

Awards Are Deferred

New York, Dec. 23.—Although no award has been announced, the low bidder on approximately 2000 tons of cast iron pipe for Newark, N. J., was the Warren Foundry & Machine Co. In the case of the two tonnages required by New York City, action has been postponed, as bids exceeded appropriations. It is believed, however, that action will not be delayed long. Despite the close proximity of the holiday season, private demand continues in good volume, although there is a slight falling off. Included in recent buying are some fairly good tonnages for Brazil, Argentina and Japan. Brazil is reported in the market for a requirement which eventually will reach 25,000 tons. Prices are strong, but unchanged.

Back to January Level

Chicago, Dec. 23.—With prices on cast iron pipe advanced $4 late last week, the base price is increased to $60, Birmingham, for 6-inch, which is exactly the quotation at which the year started. This brings 6-inch pipe to $66.80, delivered, Chicago, and 4-inch pipe to $69.80, delivered, Chicago. Fittings have been advanced $5 per ton, in keeping with the advance on pipe. Elyria, O., has not yet made an award on its inquiry for several thousand tons. Bids will be opened Jan. 5, at Rio, Wis., on 170 tons.

Pipe Plants in South Busy

Birmingham, Ala., Dec. 23.—All cast iron pipe plants in the Birmingham district are busy, and have orders in hand for large tonnages. The National Cast Iron Pipe Co., Birmingham, is to increase the capacity of its plant at Boyles with an additional pit, a specialty department, and other additions. Shipments of pipe from this district are steady, when cars can be furnished by the railroads.

Considers Asian Plant

Ground has been broken for a 50 x 150-foot building at the plant of the Truscon Steel Co., Youngstown, O. The officials of the company are centering their efforts on available business in the Far East markets having a fabricating plant under construction in Japan. The company also is considering the erection of a similar plant at Singapore, Straits Settlements, Asia.

Steamer chartering has dwindled to a point which makes it a negligible factor in shipping. Only seven charters were reported in New York last week. The situation is due to the coal strike.

Sheet Shortage Growing

Though Mill Operations Continue to Increase, Supplies are Almost Unobtainable — Valley Mills Sold Up For First Quarter

Pittsburgh, Dec. 23.—Although the fuel situation is not normal and the shortage of sheet bars remains a restrictive factor, sheet mill operations continue to improve. Several independent plants in the valley and Wheeling districts which suspended or curtailed production as a result of the coal scarcity, now are operating at about the same rate as before the coal shortage. The American Sheet & Tin Plate Co., this week has more than 90 per cent of its sheet mills in operation, as compared with 70 per cent during the fuel shortage. The company has gone outside its regular sources of supply for sheet bars, obtaining some tonnages from Chicago. The supply situation remains extremely tight, for while the bulk of current production is being applied to standing obligations, stocks in second and third hands are almost nil as a result of the constant and heavy drafts of the past few months. Galvanized corrugated sheets are almost unobtainable, while galvanized sheets can be had for early delivery only at big premiums over recognized market bases. Some business in the latter is reported to have been done recently as high as 7.00c, base. Sharp distinction is being made by all manufacturers between regular and occasional customers. The former's requirements are being met as far as possible at regular prices, but the latter find they can make purchases only by paying prices based on current prices.

Large Premiums Paid for Sheets

Philadelphia, Dec. 23.—Sheets continue exceedingly scarce, and the amount of premiums being paid is indicated by the fact one interest bought galvanized corrugated at 8.50c, Pittsburgh. The lowest price on blue annealed sheets is 4.05c Pittsburgh, for No. 10. A big tonnage for both the domestic and export trade is being turned away.

Turn Down Inquiry

Chicago, Dec. 23.—Manufacturers of steel sheets are unable to cope with the flood of inquiry now being received and much of it is being turned down. The plea of most consumers is that they are increasing their volume of business, while producers advise them they must reduce their volume to keep within reach of present supply of raw material. The principal producer recently opened its books to old customers but booked all it could contract for within a short time and again has retired from the market.

First Quarter Tonnage Sold

Youngstown, O., Dec. 23.—From present indications makers in this territory will have nothing for sale for the first quarter. Inquiries for all grades are heavy but only in rare cases are they entertained. They average anywhere from carload lots to 100 tons each. No letup is noticed in the demand for light-gage black and galvanized. Blue annealed sales to western consumers have decreased considerably. Shipments of this grade especially in 12 gage or heavier, to eastern points also are light.

Waster and cutdown sheets are difficult to find. In some cases they are commanding a price higher than that quoted for prime stock. Consumers, finding it almost impossible to locate first grade sheets, have become heavy buyers of defective stock and as a result a strong market has been created in this direction. A bid of 5.90c for galvanized wasters was made recently but failed to uncover any tonnage. All sheet plants here will close Wednesday evening. Little repair work is contemplated on account of the large amount of business booked.

Wire Tonnage

For January Offered by One Maker on Higher Basis

Pittsburgh, Dec. 23.—Little tonnage of nails or other wire products is available for early delivery, although one of the independent companies recently opened its books for a limited amount of business for January shipment in nails, staples and barbed wire. Nails are priced at $4.25, base, Pittsburgh, in this allotment, staples at $4.25 for polished and $4.95 for galvanized and barbed wire at $3.65 for painted and $4.35 for galvanized. While all makers of wire and wire products are doing better in the matter of plant operations than recently, not much headway yet has been made in cutting down old obligations. Small sales of both nails and wire have been made at considerably above the prices named for early shipment. While the possibility is slight that the American Steel & Wire Co. immediately will make any change in its prices, it is understood that the independent companies are considering a new base and a new card of extras on nails. It appears to be a general feeling among the independent wire companies that until nails are placed upon a profitable basis, they should not increase production. The shortage of nails is extremely acute and no relief apparently is likely soon.

Production Improves Slowly

New York, Dec. 22.—Wire production continues to improve slowly, and many consumers are unable to obtain enough material. Mills are trying to take care of their customers to the best of their ability, and the leading interest is booking a day-to-day business on the same price basis of 3.25c, Pittsburgh, for wire nails and 3.00c for plain wire which it has maintained since last March.

Bar Demands Unsatisfied

New Requests for Tonnage Pour in and Accumulated Orders Are Not Diminished—Ford to Need 150,000 Tons for Rims

Chicago, Dec. 23.—Efforts of consumers to buy soft steel bars are almost futile, the leading independent being unable to book anything further before July 1, 1920. The leading interest has little to offer and this only to regular customers. At present this interest is selling only for first quarter specification, which means in most cases delivery during the second quarter, and little tonnage remains to be disposed of. The situation is uncertain because of the possibility that weather conditions may limit fuel shipments and lessen operations. The quotation remains unchanged at 2.62c, Chicago.

Production of bar iron is being resumed. The East Chicago mill is in operation with large bookings and much inquiry which it cannot consider. At present quotations are 2.87c to 3.00c, mill, with the probability of the higher figure being standard within a few days. Railroads are in the market for some of this material, and consumers in the east are inquiring from western producers, as their own sources are unable to supply them.

Mills producing hard steel bars from old rails are resuming operation after having been closed for lack of fuel, and have contracts and specifications covering at least three months' production. While the last sales at a specified price were at 2.85c, mill, all recent selling provides that the price shall be the quotation in effect at the time of shipment.

Mills Refuse Large Tonnages

New York, Dec. 22.—It is becoming more difficult to place orders for steel bars. Occasionally, orders are being closed at prices ranging from 3.00c, Pittsburgh, to 4.00c. Some export business has been taken at the latter figure. Mills are making every effort to provide their regular customers, some of them allotting a certain tonnage a month. Some large forging bars have been taken by an eastern mill at 3.50c, Pittsburgh, and small bars at 3.75c. The latter are sold up to a greater extent than the larger sizes of material. Eastern bar iron makers generally now are quoting 3.50c, base, Pittsburgh. One feature of recent buying is the substantial tonnages called for by South America.

Big Premiums Paid for Steel Bars

Philadelphia, Dec. 23.—Steel bars are bringing all kinds of prices. While a large number of consumers are being supplied at 2.35c through regular sources, many are paying as high as 3.50c, Pittsburgh. In fact, the premiums being paid depend on what will tempt the mills to enter tonnages, as there are many consumers with whom price is no object. Most mills are booked for from five to six months ahead. Some could give better deliveries, but will book no more business at this time, saying they do not know what costs will be, and that they expect to see prices go higher. Current prices of iron bars range from 3.00c to 3.75c, Pittsburgh.

Demand Still Unsatisfied

Pittsburgh, Dec. 23.—While shipments of merchant bars on old contracts are larger than they were recently, the fact that new demands still are pouring in indicates that no appreciable inroads have been made by the mills against their accumulated orders, and that the immediate requirements of buyers are unsatisfied. While the leading interest holds to the base of 2.35c, Pittsburgh the bookings carry no guarantee as to time of delivery. Independent makers who also are holding that base, are accepting no new orders. Independents who are taking business, either are stipulating a price at time of delivery or quoting 3.00c, base, Pittsburgh, or higher. That was the best price quoted a Pittsburgh district maker of cold-finished bars on a recent inquiry for 10,000 tons of bars. In some quarters a 4-cent bar market is looked for with the explanation of billets carrying the March 21 price. The market on 4 x 4 billets is now up to $45 to $50 a ton, while conversion costs are put at about $20 per ton.

New demands for concrete reinforcing bars are light, but most makers have several weeks' business booked. Rerolled bars of this sort are quotable from 3.00c to 3.50c, mill.

Iron bars still are sought, and 3.50c, base, for common bars is reported to be easily obtained. The Pennsylvania railroad is seeking first quarter tonnages of both common and specification iron, and chain makers also are in the market for first quarter supplies.

Out of Market for First Half

Buffalo, Dec. 22.—Buffalo bar mills are out of the market for first half business. Demand is still strong. Some mills have not booked business for the first quarter, owing to uncertainties in regard to the supply of raw material. Considerable 1920 capacity will go to the production of 1919 tonnages which were held up by the strike. Mill operation is about 70 per cent of capacity.

Big Tonnage in Sight

Cleveland, Dec. 23.—A tremendous demand for bars and bar mill products continues current and much of this still is coming from the automotive industries. While most of these consumers in this territory are comfortably covered some of them are seeking additional tonnage and they are having great trouble to place it because the mills are so filled. Some large tonnages are being talked of as representing probable requirements of leading automobile builders for next year. It is understood that the requirements of rim stock of the Ford Motor Car Co. for 1920 have been placed at 150,000 tons of which 40,000 tons would come to plants in Cleveland territory doing work for this interest. The leading producer continues to take some business from its regular trade at 2.35c, Pittsburgh, but this is limited to the amount these buyers have been accustomed to order and outsiders are not being accommodated.

Sell Over 4.00c Base

Pittsburgh, Dec. 23.—The former base price of 3.60c, Pittsburgh, for cold finished steel bars means little so far as current sales for prompt delivery are concerned. Actually, 4.05c, base, has been obtained recently on bessemer screw stock, and in view of the fact that makers are unable to obtain bessemer billets in the base size for less than $50, still higher prices appear likely in the near future. Bessemer steel capacity has remained stationary in recent years, the tendency of the industry being to increase steel production through the medium of open-hearth furnaces. It is asserted that the automotive industry alone requires enough bessemer steel in the form of screw stock to warrant a larger production. Deliveries of merchant bars to the cold-finishing mills still are too small to permit of an increase in operations of the latter. Some of the larger makers still are quoting 3.60c, base, but cannot take on new business at that figure. The Wyckoff Drawn Steel Co., with a plant at Ambridge, Pa., started operations and made its initial shipments last week. This plant has a monthly capacity of 6000 tons of cold finished steel and probably will be running full early in 1920.

No Let Up in the Demand

Pittsburgh, Dec. 23.—Makers of nuts and bolts in this district still are up against the proposition of trying to meet an abnormal demand with subnormal supplies of bars and rods. Since this cannot be done new business is being turned down, even at the higher prices established in the past few weeks. Merchant bars for early or specified deliveries are unobtainable much below 3.00c base, Pittsburgh, as compared with the former base of 2.35c. Wire rods of the best grade have been selling at $65 per ton or higher, at least $13 a ton over the March 21 base. Shipments of bars against contracts are moderate as steel production in the Pittsburgh district has suffered considerably in the past week because of the fuel situation. The supply of producer gas has been affected by the coal shortage while little or no natural gas has been available for industrial uses. The situation in rivets is not quite so taut as with nuts and bolts, since no railroad demand has developed.

Warehouse Demand Big

New York, Dec. 21.—Despite the near approach of the holiday season, local warehouse interests continue to be fairly deluged with business. Demand for sheets, steel bars, hoops, bands and, in fact, for most all descriptions, remains heavy. Plates and heavy structural shapes are in not

such active demand, but, nevertheless, these descriptions are moving more rapidly. As indicated last week, an advance has gone into effect in machine bolts, the larger sizes now being quoted at a discount of 20 per cent, and the smaller at 30 per cent. Iron bars also are moving upward, the current market being 4.00c, New York.

The Pittsburgh Steel Co. is sending out as a holiday souvenir, a nickel plated envelope opener made from a 9-inch wire spike.

Offer Big Plate Business

40,000 Tons For 16 Oil Tankers Among Current Inquiries—Contracts For First Quarter Made at From 3.00 to 3.25—By Eastern Mills

Philadelphia, Dec. 23.—A huge plate business is being offered from all sides, the largest probably being involved in an inquiry for 40,000 tons for ten tankers, from which are likely to be let to Pacific coast yards, for the Southern Pacific railroad, and six for the Sinclair Oil Co. Inability to get steel may hold up this business. Some plate business was done in this district in the past week at 2.85c, Pittsburgh, and this was the minimum. Most sales were at 3.00c, and a considerable number were made at 3.25c. Three cents now seems to be the minimum. Some first quarter contracts were taken from insistent buyers at both 3.00c and 3.25c. The best delivery to be had in the East is five weeks for universals, and three months for sheared. Due to the fuel situation, as well as to the indifference of the men in some cases, the output of eastern plate mills is not greater than 85 per cent. On bids opened last Friday, the Carnegie Steel Co., offered 16,000 tons of plates and shapes to the government at 2.50c and 2.40c, Pittsburgh, respectively. However, this interest now seems to have an absolute minimum of 2.65c and 2.45c on all other business, and no longer is quoting the special price of 2.50c on plates, at which figure it was taking ship business only a few weeks ago. Included in recent export orders are some round tonnages of plates for shipyards in Belgium, France and England.

Bookings Are Heavy

Pittsburgh, Dec. 23.—Demand for plates is now coming from practically all classes of users. In addition to demands from the tank builders, structural interests and the ship builders, a number of inquiries for small tonnages have been received from the railroads. Plate mill operations in this district are increasing as the coal situation improves, but few makers are in a position to make shipments earlier than the latter part of next month and enough business is in sight to keep some plants busy for at least the first quarter of 1920. No more than 2.75c, base, has been paid here, while the Carnegie Steel Co. continues to accept business at 2.65c. Some of the valley makers also are holding at the 2.65c, base, but the word from the East is that as high as 3.00c and 3.25c, Pittsburgh, is being quoted.

Ship Tonnage Leads

Chicago, Dec. 23.—In addition to the large purchase of shipbuilding material, mostly plates, by a Pacific coast builder last week, the total of which now aggregates 75,000 tons, sufficient for four or five hulls, a Gulf shipbuilder is in the market with an inquiry for plates and shapes for the construction of four steel barges. The tonnage involved is not known. Plate mills have some unsold tonnage for first half, but recent bookings are sufficient almost to fill productive capacity. The quotation has not been changed from that prevailing for some time, 2.92c, Chicago.

Corporation Buys Alloy

New York, Dec. 22.—The United States Steel Corp. is reported to have closed for its 1920 requirements of 50 per cent ferrosilicon, involving 12,000 tons, at between $80 and $85. Last year the corporation's blanket contract covered a maximum of 30,000 tons for 1919 delivery. The Andrews Steel Co. is reported in the market for 600 tons for first half. Recent carload sales have been reported at $80, delivered Pittsburgh and Buffalo districts.

One of the domestic makers of ferrotungsten is reported to have reduced quotations to $1.05 a pound contained, while brokers offering foreign alloy are asking around $1 a pound contained. Inquiry for ferrotungsten is light.

Several large contracts for ferrochrome for 1920 delivery have been closed, at prices said to be around the basis of 22 cents per pound contained, delivered for alloy containing 6 to 8 per cent carbon. The prices made by domestic manufacturers by whom the business was closed were developed in close competition with foreign sellers, largely French. Domestic makers are obtaining 24 to 25 cents per pound contained for spot carloads of ferrochrome.

A number of contracts for ferrovanadium for next year's delivery have been closed on the basis of $6 a pound contained for alloy containing 30 to 40 per cent vanadium. Some sellers are realizing $7 a pound contained on relatively small lots of high grade ferrovanadium for early delivery.

After entering considerable ferromanganese tonnage during the past week at $120, delivered, domestic makers have advanced their price to $130, delivered. As far as known this figure has not yet been done. There is a total lack of pressure to sell ferromanganese and the situation is quite strong. The lowest price now being quoted on English ferromanganese is $120, c.i.f. tidewater, for second quarter and the tonnage offered is limited. More than 1000 tons of English ferromanganese for the second and third quarters have been booked at $130 tidewater but the offering at this price is limited.

Spiegeleisen is quiet but strong and, on the basis of the last sales, still may be quoted at $39 to $41, furnace, on 19 to 21 per cent metal. There apparently is only one seller at this level. One maker for several weeks has been holding for $45, furnace. Included in the demand for spiegeleisen is considerable export inquiry.

Buy Ore at 55 Cents

Philadelphia, Dec. 23.—Several thousand tons of Cuban, Indian and Brazilian manganese ore has been bought by domestic consumers during the past week at 55 cents per unit tidewater. The market is reflecting a tendency toward higher levels particularly by reason of the buying by England, Belgium and France.

Sell Domestic at $130

Philadelphia, Dec. 23.—Domestic makers here sold 2500 to 3000 tons of ferromanganese at $130 delivered largely for the second quarter.

Ferromanganese Again Advances

Pittsburgh, Dec. 23.—Most domestic makers of ferromanganese now are quoting 80 per cent material at $130, furnace, freight allowed, but this price as yet lacks real basis in sales. While a few small tonnages are reported to have been sold at that price, sellers who have recently quoted $120 report that no business resulted and buyers say they have been able to secure supplies for less than $120. General demands are not particularly large for this alloy, with consumers disinclined to buy much ahead of their actual needs. It still is possible to buy English ferromanganese running 76 to 80 per cent manganese content as low as $110, c.i.f. Atlantic seaboard.

Demand for spiegeleisen is sporadic and involves only small tonnages, with first quarter shipments generally priced at $40, furnace, while $37 to $38 is being quoted by some makers on prompt shipments.

Ferro Quotation Higher

Chicago, Dec. 23.—Ferromanganese, which has been selling at $120, furnace, freight allowed, has been advanced to $130, in the absence of English ferro, which is not being shipped. Sales have been made in this territory at the new figure. The market for spiegeleisen is entirely dead, with $45, furnace, being asked but with the probability that tonnages could be placed at $40, furnace.

Big Projects Coming Out

Five Structural Jobs in New York Will Require More Than 25,000 Tons—Pittsburgh Mills Well Booked—Good Awards in Chicago

New York, Dec. 21.—New projects coming to the fore in the local structural market involve a heavy tonnage of steel. More than 25,000 tons will be required for five projects likely to develop in the near future. A new department building to be erected on Park avenue, between Forty-ninth and Fiftieth streets, by T. Coleman du Pont and others, will require from 4000 to 5000 tons. The Thompson-Starrett Co. will have charge of the construction. An office building at Forty-second street and Madison avenue, to be erected by the Winchester Arms Co., Fred T. Ley & Co., and others, will require about 6000 tons. Another building to be constructed at Thirty-eighth street and Seventh avenue by a syndicate of clothing manufacturers will call for 6000 to 7000 tons. Two office buildings on Fifth avenue, to be erected by George Backer, will require a total of 13,000 tons. One, to be erected at the corner of Fifth avenue and Fifty-seven street, will involve 6000 tons, and the other, to be built between Thirtieth and Thirty-first streets, 7000 tons. Plans are being prepared by Warren & Wetmore, architects, and, according to the present schedule, construction will be started in March. Bids on at least three jobs will be taken soon. Awards of the week were light.

Round Tonnage is Sought

Boston, Dec. 22.—The structural steel situation is under the combined influence of winter weather and slow deliveries and the market is quiet. Inquiry for future delivery of structural shapes continues favorable, although the awards apparently are being held up until after the first of the year. The largest award made during the week was for a $3,000,000 manufacturing building at Cambridge, Mass., which will take approximately 3500 tons of steel. The steel award has not yet been made.

Large Tonnages Turned Down

Philadelphia, Dec. 23.—Shape mills are unable to cope with the great demand for material for nearby shipment. One eastern mill turned away 14,000 tons today. While some sections can be had for delivery next week others cannot be had for four months. Consumers offer tempting premiums, which some mills cannot resist. There has been some business in the past week at 2.75c, Pittsburgh. In structural shapes, however, this level is exceptional, and the general level of eastern mills is 2.55c, Pittsburgh. Last week's report that one eastern mill took first quarter shape contracts at 2.55c was in error. This business was done at 2.45c. Eastern mills are selling pickups for spot shipment at from 2.75 to 2.85c, mill, which is considerably lower than the warehouse price in this district. The mills say that some consumers already have specified all their first quarter tonnage, and want more, but there is no more to give them. The Belmont Iron works took 2000 tons for two new shipways and other work at a shipbuilding yard in Chester, Pa.

Mills and Shops Well Booked

Pittsburgh, Dec. 23.—Both the shape mills and the fabricating shops in this district are well booked with business, although comparatively few structural lettings recently have been placed. A number of projects are up for bids, however, and in the view of the fact that deliveries of plain material have slowed down considerably, and of the possibility of higher prices for early deliveries, belief is strong that the turn of the year will bring the letting of these jobs. Much business in plain structural material has accumulated at the mills, due to the recent interruptions to operations occasioned by the steel and coal strikes. Small shapes remain extremely scarce, due in part to the congestion of orders for merchant mill products.

Building Active in West

Chicago, Dec. 23.—Building activity in the west continues to bring a number of moderate tonnages to fabricators, the largest placed recently involving 700 tons for a theater building in San Francisco. Other tonnages placed recently are for smaller lots. Bids have been asked in Chicago on 750 tons for a theater building. The Alaskan commission is inquiring for 1500 tons for a bridge on the government railroad, and the United States Copper Co., is asking for bids on 350 tons for a boiler house at Clarksdale, Ariz. Plain material is steady at 2.72c, Chicago.

CONTRACTS AWARDED

Automobile body manufacturing plant for Seaman Body Corp., Milwaukee, 750 tons to Milwaukee Bridge Co.

Addition for Harvey Spring & Forging Co., Racine, Wis., 300 tons to Wisconsin Bridge & Iron Co., Milwaukee.

Manufacturing and power plant extensions at Mark plant of Steel & Tube Co. of America, Indiana Harbor, Ind., 3000 tons to Worden-Allen Co.

Rolling mill foundry for Hubbard Steel Foundry Co., East Chicago, Ind., 375 tons to Northwestern Bridge & Iron Co.

Assembling building for Cadillac Motor Car Co. at Milwaukee, 125 tons to Northwestern Bridge & Iron Co.

Artillery drill shed for the Hunt armory, Pittsburgh, 700 tons to the American Bridge Co.

Plant extension Pittsburgh Seamless Tube Co., Beaver Falls, Pa., 350 tons, to the McClintic-Marshall Co.

Building for Philadelphia Paper Co., Philadelphia, 300 tons to the McClintic-Marshall Co.

Theater building for the Ackermann-Harris-Lowe, Inc., San Francisco, 700 tons, to Dyer Bros.

Structural steel for foundry and machine shop building for the A. Plamondon Mfg. Co., Chicago, 518 tons, to Northwestern Bridge & Iron Works.

Two oil tanks at East Chicago, Ind., for the Sinclair Refining Co., 478 tons, to American Bridge Co.

Buildings at East St. Louis, Ill., for the Monsanto Chemical Co., 450 tons, to Christopher & Simpson.

Extension to Sherman Hotel, Chicago, 382 tons, to Strobel Steel Construction Co.

Additions to boiler house for the Ingalls-Shepard Forging Co., Harvey, Ill., 350 tons, to Kenwood Bridge Co.

Factory buildings for the Service Motor Truck Co., Wabash, Ind., 222 tons, to independent shop.

Craneway extension and alterations for Nash Motor Co., Kenosha, Wis., 100 tons to Northwestern Bridge & Iron Co.

Building for the Hartford Rubber Works, Hartford, Con.., 300 tons, to the Phoenix Bridge Co.

Fertilizer plant for the Armour Co., Chrome, N. J., 300 tons to an independent shop.

Addition for the Nichols Copper Co., Laurel Hill, N. Y., 350 tons to independent shop.

Building for the Magor Car Corp., Passaic, N. J., 400 tons to the American Bridge Co.

Plant addition for Willys Corp., Elizabeth, N. J., 4200 tons, to the American Bridge Co.

Shipways and other shipyard work at Chester, Pa., 2000 tons to the Belmont Iron Works.

CONTRACTS PENDING

Theater building for Baliban & Katz, at State and Lake streets, Chicago, 750 tons, bids asked.

Boiler house for U. S. Copper Co., Clarksdale, Ariz., 350 tons, bids asked.

Shipping building and loading dock for Oakland Motor Car Co., Pontiac, Mich., 400 tons, bids asked by Dupont Engineering Co.

Additions to bessemer plant at Indiana Harbor, Ind., for Steel & Tube Co. of America, 2200 tons, bids being taken.

Foundry at Muskegon Heights, Mich., for Manning, Maxwell & Moore, Inc., 700 tons, bids being taken by F. D. Chase, Inc., Chicago.

Implement plant for Samson Tractor Co., Janesville, Wis., 500 tons, bids asked by Dupont Engineering Co.

Bridge on Alaskan railroad, 1500 tons, bids asked.

Liberty tunnel through South hills, Pittsburgh, 1100 tons, general contract to Booth & Flynn, Pittsburgh.

Plant addition and crane runway for American Car & Foundry Co., Buffalo, 1500 tons; contract pending.

Manufacturing building at Cambridge, Mass., 3500 tons. Bids being taken.

More Rails Are Pending

New York, Dec. 22.—Practically all of the rail tonnages which were under negotiation in this district for delivery during 1920 have been closed. They include 150,000 tons for the New York Central lines, 135,000 tons for western roads which do their purchasing in New York, and tonnages for other eastern roads having their headquarters in this district. The total involved was in excess of 335,000 tons and probably was close to 400,000 tons. A significant feature is that while some roads placed the orders tentatively, subject to cancellation in case the roads are not returned to their owners, certain roads placed definite orders without making any such stipulation. It is understood that the bulk of the business was placed on the basis of $47, mill, for standard open-hearth rails, plus extras for special specifications.

4000 Cars Are Wanted

Philadelphia, Dec. 23.—Inquiries are out for a total of 4000 freight cars for two railroads. The Baldwin Locomotive Works has an order for 50 locomotives for Egypt.

High Prices on Export Rails

Pittsburgh, Dec. 23.—While it is reported that most of the important railroad systems of the country are making reservations for standard rails for delivery next year, orders have not developed here. Such business as is being booked runs largely for small tonnages. Export inquiries, however, are quite numerous and include some fair-sized tonnages of both light and

standard sections. These involve 10,000 tons, and it is said that the best price named by any of the makers was $60, mill. In the lack of new business makers are catching up on their orders for small spikes. Standard spikes still are wanted only in small lots.

Rail Tonnage Pending

Cleveland, Dec. 23.—From 10,000 to 11,000 tons of rails for 1920 delivery for those roads which buy in this district are pending. The largest lot is 4000 tons for the Wheeling & Lake Erie. The Clover Leaf and the Ann Arbor are in the market and an inquiry is expected soon from the Nickel Plate.

Big Order About to be Placed

Chicago, Dec. 23.—Negotiations for standard steel rails for western railroads are being drawn to a close with practically 400,000 tons involved. The only element now causing doubt is the date when the roads will be returned to their owners. Under present conditions it seems likely that the rails will be taken by either the roads or the railroad administration, as they are needed. Activity in track fastenings is about equal to that in rails, with corresponding tonnages under negotiation or recently closed. Light rails are active for both domestic and export buyers, while some users are asking contracts for six months supply. The recent inquiry of the Great Northern railroad for 1000 stock cars has been withdrawn. The Seaboard Air line is asking inquiries on a few passenger cars, involving about 140 tons.

Sell Semifinished High

Transactions Closed at $51 For Sheet Bars and $50 For Slabs—Rerolling Billets Up—Pittsburgh Draws on Chicago Mills

Pittsburgh, Dec. 23.—Prices for prompt tonnages of billets, sheet bars and wire rods still are ascending except for the occasional sales of tonnages which manufacturers have had on their yards. On newly made steel, all manufacturers with the exception of the United States Steel Corp., and one or two of the independents, have price ideas based on the higher value of pig iron and the advanced figures obtainable on prompt tonnages of finished steel. Sales of forging billets are noted here at $64 and no further business would be accepted by the seller of this tonnage now at less than $65. Rerolling billets have been quoted as high as $54 for the base size and $53.75 has been quoted against an inquiry for 1½ x 1½ billets, which is equivalent to $50 for the base size. It is doubtful if less than $50 for the base size of rerolling billets and $60 for forging billets now would be considered by more than one or two makers. The shortage of sheet bars still is acute and even the American Sheet & Tin Plate Co. is suffering, at least to the extent that it lately has been obliged to draw some heavy shipments out of Chicago territory for its finishing mills in this district. Freight eastward is about $5 per ton, as against an average charge of about $1 a ton when supplies are drawn from nearby sources; so the delivered cost of its sheet bars is $4 per ton higher than usual. While all makers of wire rods appear to have tonnages for sale, the demand is sufficient to readily absorb them at well sustained prices, the range being from $63 to $67 for soft steel. The leading wiremaker, however, still is quoting $52 and states it is making some sales at that figure.

Bid $60 For Bars

Youngstown, O., Dec. 23.—Sheet bars are extremely scarce in this territory and it is doubtful whether any tonnage could be bought for less than $51. Last week a bid of $60 was made for only a fair size tonnage but failed to uncover any material. The leading maker has no semifinished tonnage to offer for first quarter delivery and refuses to sell beyond this period.

Close at $50 and $51

Cleveland, Dec. 23.—Transactions involving large tonnages for first quarter delivery have been closed by makers in this district on the basis of $51 for sheet bars and $50 for slabs. While no sales of billets are reported, producers express the opinion that $48.50, Pittsburgh, for 4 x 4-inch, and $51 for small billets are representative.

The Nonferrous Metals

	‡Copper	Future Straits N. Y.*	†Lead. New York basis	Zinc St. Louis basis	Aluminum	Spot antimony	Nickel ingot

†American Smelting & Refining Co.'s price.
‡Open market.

NEW YORK, Dec. 23.—Erratic movements of foreign exchange rates dominated the nonferrous metal markets the past week. Sterling exchange rates recently declined to $3.66 for checks, then quickly recovered to $3.90 on Dec. 17, reacted to $3.73¾ on Dec. 18 and recovered to $3.82 on Dec. 22. In view of the fact that a difference of one point in exchange means a difference of 15 points or about ⅛c a pound in the price of tin, the importance of the fluctuations of exchange in the tin market are appreciated. In two days, recently, an extreme range of 24 points in exchange made a difference of about 3c a pound in the cost of importing tin. In the other metals, which have owed much of their current strength to foreign markets, the fluctuations of exchange have exerted great influence.

Copper has held steady at 18.50c, this price being quoted by producers to good consumers, but the tendency is to 18.75c. Dealers are not yet able to buy any large amount of copper from producers, but appear to have covered their short contracts. Further big Japanese business was booked and also some French, English and German. It is estimated that upwards of 40,000,000 pounds of copper have been sold for export thus far in December, about 20,000,000 pounds of which have been bought by Japan for first quarter shipment. Domestic business also is big, much being done quietly. Casting copper continues scarce and makers are not offering freely, owing to high prices quoted on scrap. Lake copper is quoted nominally at the price of 19c.

The lead market has been steadily advancing. The leading producer advanced its quotation to 7.15c New York, 6.90c East St. Louis, Dec. 18. Producers are well sold up both for December and January shipment and stocks of spot lead in outside hands are extremely small. The outside market has been 7.30c and higher, New York delivery. The London lead market advanced £5 from Dec. 1 to Dec. 23, to £44 5s as of the latter date.

Zinc was quiet but in the past two days has been strong. Exchange interfered with export for a time. The aproach of the year-end inventory has deterred some domestic consumers from covering at present, but a fair interest from galvanizers has been nevertheless reported. Prime western sold at 8.50c East St. Louis today, and for first quarter shipment 8.55c was quoted, advances of about 20 points over the past week. Sheet zinc is up to 11.50c.

Tin prices have been extremely irregular. The London and Singapore markets have advanced just as rapidly as Sterling exchange declined, and when exchange rates recovered the London tin market advanced just the same. The total advance in London from Dec. 1 to Dec. 22 amounted to about £30, equal to about 5⅛c a pound. The Sterling exchange market dropped from $4 to $3.82 as of Dec. 22, equal to a reduction of about 2¾c a pound in the cost of importing tin. The price of future shipment Straits tin as of Dec. 1 was 54.50c to 54.62½c; as of Dec. 23, 56c to 56.50c. These prices were made by interests who were taking profits. The actual cost of importing Straits tin as of Dec. 22 was 57.50c, based on the current London market.

Selling Strip Steel for Second Quarter

Pittsburgh, Dec. 23.—Although makers of strip steel have been trying to keep their bookings within the first quarter of 1920, a number of them have found it impossible to do so because so much 1919 business is still unfilled that they could not offer any tonnage for shipment over the first quarter. Consequently they are taking business from regular customers for shipment during the second quarter. The supply situation still is extremely tight and no trouble would be had in obtaining more than the base price on first quarter shipments. Demand for hot-rolled strip steel is extremely heavy and intimations of another advance of $5 per ton are being heard, due to the increasing cost of billets. Some manufacturers report the receipt of quotations as high as $54 for 4 x 4 billets during the past week.

Appoints Superintendent

I. Lamont Hughes has been appointed general superintendent of the Youngstown district for the Carnegie Steel Co., Pittsburgh, effective Jan. 1, 1920, according to an announcement made in the latter city on Dec. 23. In this position, he will succeed James H. Grose, whose resignation will become effective at that time.

Quotations For Export Soaring

Trading Agencies Depending on Foreign Sales of American Iron and Steel Begin to Feel the Pinch of Material Shortage—Demand From Abroad Showing no Abatement—German Competition Looms as Possibility

NEW YORK, Dec. 22.—By modifying their operations and curtailing their office forces, most of the export houses depending primarily on iron and steel trade are meeting the present shortage of material. Business current today is very small although the inquiries from abroad show no abatement.

There is a very heavy export demand for 30 gage sheets, which American mills are in no position to furnish and exporters are scouring British, Belgian and other European markets with but indifferent success. Export demand for all lines of semi-finished and finished steel would be even heavier but for the present unfavorable exchange rates. Following the recent order by the Holland government for rails for the Dutch East Indies railroads a further small order involving about 500 tons of light rails has been placed here. The export demand for pig iron also is heavy but little business can be done. Due to the shortage of the supply much business has been diverted to England. British producers can furnish pig iron on the basis of £8 9s, delivered at continental ports, which is equivalent to about $40. American iron at the present market could not be delivered for less than $45 to $48 per ton. Inquiries for export are in the market for some 5000 tons of basic but so far no furnace has been found to quote.

About 10,000 tons of basic originally purchased by Japan, has been bought by a dealer. It is understood that this iron was sold because the importers were able to use the ship space to better advantage.

Steel bars have been sold for export at a price equal to 4.00c, Pittsburgh, it is reported. It is declared bars can not be purchased for less than 3.25c, Pittsburgh. Tubes 2½ inches and under brings a discount of but 53 under the list, even for second quarter delivery, and the larger tubes carry a discount of but 51 off. One eastern mill offered a few thousand tons of black plates for export at a premium of $38 a ton over the schedule price. Tin plate has been selling for $8.25, Pittsburgh, and some sellers are asking $8.50. The price of tin plate at the present time, provided any stable price is quoted, is $10 c.i.f. A foreign sale of tank plates was made at 3.25c, mill, and a premium of approximately $10 a ton has been paid on wire.

France has approached the market with an inquiry for 600,000 ties, but the exporters are giving the matter little consideration. Italy is also asking for 4000 cases of tin plate but the order cannot be filled. Denmark has purchased 200 tons of plates at 3.25c, which will be delivered during the second quarter. Holland has taken a small tonnage of barbed wire. Portugal has bought 2000 coils of wire.

While sales to England are proving difficult, the American exporters have been able to dispose of some little material to the British colonies. India has purchased 150 tons of structurals, 150 tons of nail wire, a small tonnage of zinc sheets, and 500 tons of wire. It is also learned that a deal is in contemplation for the sale of some $250,000 worth of industrial machinery to India.

The Orient remains the best market. The Oriental banks are extending credits to their people making purchases abroad, and drafts against this credit can be drawn as soon as the goods are placed on the ship. Japan has been inquiring for black sheets and small bars principally, while China's chief requirements appear to be bars and galvanized wire. From the Orient has come an inquiry asking whether or not a particular agency can furnish a total of 160,000 boxes of tin plate for deliveries distributed throughout next year. It was also learned that China has recently sent to this market inquiries for 21,000 kegs of counter-sunk checkered nails.

Japan has asked for 5000 tons of 12-pound rails, 2000 tons of 16-pound rails, and 500 tons of 20-pound rails. The business was not closed because of the price. One Japanese order for tin plate placed calls for 4000 boxes at $8.25. Japan has purchased 300 tons of light rails, 750 tons of plates, 5000 kegs of nails and 6000 boxes of tin plate. Another export house reported the sale to Japan for first quarter delivery of 300 tons of shapes, 500 tons of plates, 500 tons of bars, 2000 tons of pig iron, 10,000 kegs of nails, 200,000 feet of pipe, a few hundred tons of wire and a small tonnage of copper. A third house reported the sale to Japan of 200 tons of black sheets and 200 tons of English gas tubes. Japan ordered 500 tons of wire for second quarter delivery, paying a $10 premium.

Japan inquired for 250,000 feet of pipe, but the order could not be placed. It has been learned that Germany had agreed to take an order which was first offered to the United States for 25,000 tons of cast iron pipe for Java and the Dutch East Indies.

Some sales of nails have been made for $57, and on export business this is the normal quotation, despite the fact that some orders have recently been closed at slightly less. This price makes the c.i.f. quotation at Yokohama $82 a ton. A Japanese order for 44 track miles of 40-pound rails was placed last week for second quarter delivery. Japan also purchased 300 freight cars for South Manchuria and 2050 couplers. The sale of 1500 tons of ammonium sulphate to Japan was reported.

Among the sales reported made to China were 400 tons of bars and 350 tons of plates. China is now inquiring for 5000 tons of heavy rails. Several thousand boxes of tin plate have been sold the Far East. Some Chinese coal mines are planning the construction of light railways, totaling about 50 miles in length, to connect the mines with the Shantung railway. The mine owners are said to be desirous of obtaining American materials. Complete equipment, including locomotives and several hundred coal cars, is desired for delivery early in 1920.

About four carloads of barbed wire were sold in South America by one export house. Another agency reported the sale of 600 tons of 60-pound relayers to Cuba. An order from Argentina for 1000 coils of oval wire was booked last week. One house reported selling through its branch in South America 500 tons of sheets, 500 tons of bars, and several thousand boxes of tin plate. A sale of 500 tons of barbed wire to Brazil was also noted. Argentina has invited quotations of 25,000 tons of cast iron piping for the enlargement of the water systems in the federal capital and in provincial towns. The installation of a water system and sewers in Bahia Blanca and the issuance of bonds for sanitation works, up to $1,584,000 United States gold, have been authorized.

British Prices Again Advanced

Scarcity of Finished and Semifinished Steel Forcing Buyers Into Market—Railroad Congestion Expected to Cause Suspension of Many Blast Furnaces—Freight Rates to be Increased, Probably 50 Per Cent, by Jan. 15

The Iron Trade Review Staff Cable

European Headquarters,
THE IRON TRADE REVIEW,
16 Regent St., S. W. I.,
London, Dec. 22.

Rate of Exchange—$3.81

SCARCITY of semifinished and finished steel is forcing buyers into the market, despite rising prices. Railroad rates, still at prewar level, probably will be increased 50 per cent by Jan. 15. The situation in regard to the railroads is confusing.

American inquiries are out for 7000 tons of galvanized sheets, but there is little prospect of delivery before summer. Sheet prices are £1 ($3.81) higher. Scarcity of sheets has been emphasized by the advance of 35s ($6.66) in the price of sheet bars. Billets are scarcer and have advanced to £17 10s (($66.68). Steel bars, English beams and tin plate also have advanced.

Inquiry for tin plate is pouring in from all parts of the world, Scandinavia is seeking 20,000 boxes. Sales for the first quarter are at £2 8s 6d ($9.24).

The London tin market is very firm and there is a big business in Welsh tin plate. Three hundred tons of Straits tin was sold yesterday at £321 ($1223) a ton.

The price policy of the makers of pig iron apparently is waiting for the settlement of the railroad rate question, and in the meantime Staffordshire pig iron has advanced. Production of coal is improving but railroad congestion is still hampering distribution. This is expected to cause banking of many stacks along about the Christmas holidays. Iron bars have advanced 10s ($1.90).

All attempts to settle the molders' strike have failed. The coal strike in the Charleroi basin, Belgium, is serious. The government has removed the embargo on the commercial exploitation of Arnold's molybdenum, high speed steel. Great technical developments are expetced to follow.

Office of THE IRON TRADE REVIEW,
Prince's Chambers, Corporation St.,
Birmingham, Eng., Dec. 11.

Rate of Exchange, $3.92

PIG iron prices are firm, with an upward tendency, and a very good demand. The market for raw material has been strengthened by further advances in finished material. In the Birmingham district and some other parts of the area covered by the Midland wages board a 7½ per cent increase in wages, effective Dec. 8, is being shared by the blast furnace workers.

There is a general scarcity of pig iron, partly due to insufficient ore supplies, but mainly to the disproportionate production of iron of poor quality which can only be used for forge requirements. Two furnaces have been started in the Northampton and Derbyshire districts, while others are being made ready.

The molders' strike serves to reduce the tonnages ordered, but foundries continue to buy pig iron, considering that they have nothing to gain by postponement. Business is hampered a good deal by the insufficient supply of cars. Works coal appears to be slightly more plentiful, as the result of the new coal order, making the selling rate to works 10s ($1.96) above that to householders. The advance of 3s 6d (65 cents) in the price of No. 1 Cleveland iron, declared last week, has not made much difference, as no great quantity of this brand is sold. There is some talk of higher prices for pig iron as the result of the increase in wages, but makers are in no hurry to make definite advances, mainly because their customers are all pledged to the limit to pay any increases in the cost of production, whether arising from wages, fuel or transportation. It is quite likely, however, that prices will be revised when the new railroad rates are announced.

East Coast hematite pig iron is more plentiful, largely because of the inability of the steel rolling mills to make full production, through the scarcity of cars. At present, there is a little iron for export, and a moderate overseas business is being done. Foreign business, however, is hampered by high freight rates and scarcity of ships.

The latest returns of the national output of coal relate to the week ending Nov. 22, and show a tonnage for the week of 4,767,578, compared with 4,679,402 tons for the previous week. The increase appears to be fairly well distributed over the various districts.

The Staffordshire makers of finished iron will have to pay an additional 7½ per cent in wages for the ensuing two months, the total advance over prewar wages now amounting to 170 per cent. For the 17 selected firms, in the district the output was 23,298 tons, compared with 21,835 tons for the previous two months, while the average net selling price was increased from £22 18s 5d ($88.71) to £23 15s ($93.10). In addition to this advance the recent agitation by the workmen on the wages board resulted in an increase of 5s (98 cents) per week to workmen whose wages are not governed by the sliding scale. This advance is intended to place ironworkers on an equal footing with other workmen benefiting from the recent 5s (98 cent) award made by the government's committee of production.

Advances in prices now are generally looked for and several were declared yesterday at the Birmingham

meeting. The inability to get American gas strip or skelp, as it is called in America, has compelled a number of English consumers to turn to the British makers. Some months ago the local mills were adversely affected by American importations, and were reduced to partial idleness. Prices were reduced from £24 ($94.08) to £22 10s ($88.20). Prices have been stiffening the last week or two and yesterday they were restored to £24 ($94.08). Steel strip was raised to £25 10s ($99.96), and steel hoops to a similar figure. Small steel bars were put up to £20 15s ($81.34). All these prices are "at works."

Prices of ordinary iron bar, although not formally revised, are steadily rising. The more general quotation is now £23 10s ($92.12) with a firm market. The hardening of American prices has removed any fear of competition from the United States, the latest quotations for American bars being £21 6s ($83.28) c.i.f. Liverpool. This would mean about £22 5s ($87.20) delivered in Birmingham, but delivery is now so uncertain that all such business is regarded with doubt, quite apart from the question of price.

All the works are full of orders, as a rule far beyond their capacity. An advance of £2 ($7.84) has been made in wire rods, carrying with it a rise also in wire.

For the present advances in nut and bolt iron are held back by a few American arrivals.

Twenty-one Furnaces Now Active in Valley

Youngstown, O., Dec. 23.—Blast furnace No. 5 at the Haselton plant of the Republic Iron & Steel Co., and the Mary furnace of the Sharon Steel Hoop Co., Lowellville, O., were placed in blast last week. This brings the number of active stacks in the Mahoning valley to 21. The Mary furnace was blown out for relining Sept. 20 while Republic's stack was banked at the beginning of the steel strike.

While fuel shipments are not normal they are sufficient to maintain mill operations. The Republic Iron & Steel Co. is operating all units at its Brown-Bonnell plant with the exception of two bar mills. This company now has three blast furnaces and 10 open hearths active. The Trumbull Steel Co., Warren, O., had five open-hearth furnaces and more than 50 per cent of its sheet and black plate departments in operation Monday. This plant with the exception of the hot and cold-rolled steel departments, has been idle for more than 10 days on account of a shortage of fuel.

Cambria Operation Now Steadily Gaining

Aside from the hindrances created by the fuel situation, little evidence of the recent labor disturbance remains at the plant of the Cambria Steel Co., Johnstown, Pa. Practically all of the men who went out on Sept. 22 have returned and plant operations and production steadily are gaining. With a restoration of normal fuel supplies, nothing stands in the way of practically full plant operations. Unskilled labor is scarce at this plant as it is at practically all steel plants throughout the country, but this condition existed even before the strike.

Seven of the 11 blast furnaces of the company are in blast, with others likely to be lighted as soon as sufficient supplies of coke are obtainable. While the men have returned to work at the mines of the company, the output of coal remains considerably below normal. This has kept down coke production and supplementary purchases on the open market have been hard to make.

Seven of the open-hearth furnaces at the Cambria works are in operation and 11 at the Franklin works now are making steel, a total of 18 out of the 32 furnaces of the entire plant. Most of the finishing capacity of the company is in operation.

More Furnaces in Chicago District Resume

Chicago, Dec. 22.—Improving conditions in mills of the leading interest are noted, one additional blast furnace having resumed production at the Gary plant, one at South Works, and one at Joliet. Seventeen out of 27 stacks at these three plants are now active, and this is the largest number in blast since the coal strike started. The open-hearth department at the South Works is being started full this week, after partial operations for the past two months. Activity in finishing mills is being carried forward in proportion to the additions to pig iron units. The leading independent is operating at about 80 per cent of rated capacity.

Metal Rolls to Advance

Upward revisions of the prices of rolls and other castings are beginning to appear following the recent steep advance in pig iron costs. It is probable that announcements will go out of increases in iron, steel and alloy rolls at an early date, but as yet the extent of the advances has not become known. Suggestions have been heard, however, regarding the restoration of the quotations in effect prior to the last reduction made in May, 1919. Roll prices were cut twice in the past year as the contribution of makers to the readjustment in the steel industry to a peacetime basis and in keeping with the price reductions made by the steel industry itself. It is claimed that the last cut in roll prices reduced the margin of profit to the vanishing point on several classes and the rise in pig iron makes necessary an increase at this time.

Corporation Announces Plans For Duluth

Duluth, Dec. 23.—An outlay of $9,000,000 will be made for extensions and improvements at the Minnesota Steel Co.'s plant in Duluth next year, according to a statement made today by George L. Reis, vice president of the company. The program provides for a wire mill of large capacity, changes in various mills, and additional equipment of the power plant. Two hundred and fifty additional houses also will be built at Morgan Park, the company's model town. The wire mill, and extensions at the present plant will be completed by the end of next year.

The program of expansion is intimated by Mr. Reis to be the beginning of the fulfilling of the agreement made by E. H. Gary, chairman of United States Steel Corp., with a committee of Duluth business men last October.

Big By-Product Plant is Put Into Operation

Birmingham, Ala., Dec. 23.—The first battery of 77 Kopper ovens of the addition to the by-product coke plant of the Tennessee Coal, Iron & Railroad Co., has been completed and is now in operation at Fairfield. Within 90 days the second battery of 77 ovens will be in operation.

Announcement is made that the by-product coke oven plant at Fairfield will meet the requirements of the company, and the plant of the Semet-Solvay Co., at Ensley, probably will not be purchased. The Semet-Solvay plant has been getting its coal for years from the Tennessee company.

Making Manganese Steel by the Open-Hearth Process

Steel Containing 12 Per Cent Manganese is Made by Open Hearth Instead of Bessemer Process Usually Employed—Method of Adding Alloy and Quenching Heat Treated Castings is Unique

Fig. 1—Modern Steam Shovel Dipper. The Dipper Front and Teeth Are of Manganese Steel

STEEL always has been an important factor in the development of equipment employed to perform the arduous tasks formerly accomplished by manual labor. This is especially true of steam shovels and dredging machinery, which have undergone a steady and rapid development since 1834 when the first power shovel was built at Springfield, Mass. The most notable improvements have taken place during the past decade when the demand for machines of large capacity and great power caused designing engineers to seek material especially adapted to the great variety of requirements imposed on the different parts of the machines. For instance, in certain castings used in the construction of power shovels, ability to withstand the abrasive action caused by contact with stone, sand, slag and similar substances is essential. It is particularly important that dipper fronts and teeth possess this property. By constant study of the requirements for steel working in contact with steel, engineers have taken cognizance of the fact that pinions are subjected to far greater wear than the gears with which they mesh. To equalize this difference, the pinions have been made of steel having greater resistance to wear than the steel of the gears. This is only one instance of many in which special specific demands have been made of the materials entering into the construction of excavation machinery.

Manganese is known to impart unusual toughness to steel and for this reason manganese steel is generally employed in parts subjected to excessive wear. The common practice at present followed by manufacturers of manganese steel for this purpose calls for a manganese content of from 11 to 14 per cent.

When manganese steel was first made in the United States, steelmakers employed the acid bessemer process for melting the steel and added the required amount of manganese as the metal was being tapped. Either this practice with slight modifications, or the electric furnace process now is followed in practically all manganese steel works in this country with few exceptions. One of the makers of manganese steel employing the open-hearth furnace is the Marion Steam Shovel Co., Marion, O. In common with other firms, the Marion company first employed converter steel as the basis of its manganese product, but several years ago open-hearth metal was adopted for this purpose and has been used with unusual success.

The company's preference for open-hearth metal is based upon the belief that with this process it is easier to maintain the phosphorus content at the low percentage desired. Moreover, the authorities at this plant are convinced that not near as many impurities are carried into the metal poured from open-hearth steel as in that in which converter steel is the base. As is well known, bessemer steel requires more deoxidation than open-hearth steel, and it is pointed out, therefore, that the addition of manganese to open-hearth metal, in which the real need of a deoxidizing agent is less than in the case of converter steel, leaves the resulting product unusually free from impurities.

At Marion the making of manganese steel is carried on in the steel foundry where castings ranging in weight from one pound to 16 tons are made. The tonnage of manganese steel averages approximately 5

FIG. 2—VIEW OF 20-TON OPEN-HEARTH FURNACE FROM CHARGING SIDE

per cent of the total output of the foundry. In October, a month somewhat below the average in production, 63,636 pounds of manganese metal was poured.

Description of Foundry

The melting equipment consists of a 20-ton, nontilting, basic open-hearth furnace and a small oil furnace for ferromanganese. The open hearth is at the south end of the east bay of the steel foundry and is served by a floor-type charging machine made by the Wellman-Seaver-Morgan Co., Cleveland. The molding floors extend the entire length of the main bay and northward from the charging platform in the east bay. The main bay is commanded by one 30-ton and two 10-ton electric traveling cranes and the side bay by two 10-ton cranes. The cores, which are made in a core shop situated in the east bay, are baked in a coke-fired oven adjoining the east wall of the building. Molds are dried in a car-type, oil-fired oven outside of the foundry building. Provision has been made for moving oven cars by means of steel cables operated by power-driven drums.

A novel arrangement has been adopted for handling the molten metal preparatory to pouring. When it is desired to make a heat of manganese steel, the furnace operator is given instructions to make steel of the required analysis. In the meantime, the necessary amount of 80 per cent ferromanganese is charged into the small furnace.

A large ladle is placed on the platform of floor scales directly under the spout of the small furnace, and the balance weights are set for the amount of manganese required, proper allowance being made for the weight of the ladle. In predetermining the exact amount of metal to be tapped, the condition and quantity of slag is taken into consideration. After the manganese has been tapped into the ladle, the balance weights are adjusted for the addition of open-hearth metal, which is bottom-poured from a large crane ladle. The rush of molten steel into the bottom of the mixing ladle has a stirring effect upon the contents and thoroughly distributes the manganese.

Process Modified if Desired

Another method of mixing which has been used successfully consists of pouring a quantity of open-hearth steel into the mixing ladle, adding the manganese, and then the remainder of the open-hearth metal. With either

FIG. 3—TAPPING SIDE OF OPEN-HEARTH FURNACE—SCALES AND FURNACE FOR MELTING FERROMANGANESE, NOT SHOWN, ARE AT LEFT OF OPEN HEARTH

of the methods described it is possible to produce metal conforming to the following specifications: Carbon, 1.10 to 1.30 per cent; phosphorus, 0.055 per cent (maximum); sulphur, 0.04 per cent (maximum); and manganese 11 to 14 per cent. Steel of this analysis is used for dipper fronts, teeth, rack and pinion castings, elevator dredge buckets, latch plates, wearing plates, propelling gears, pinions, etc.

Just prior to pouring, the metal is thoroughly teemed to insure soundness. In distributing the molten steel to the molds, it is bottom poured from the ladle in which the open-hearth steel and manganese were tapped at the furnaces. As a rule the metal is handled in 6-ton ladles, it being possible to fill two ladles of this size from each heat of the open hearth. The capacity of the furnace is three heats per day.

Heat Treating of Castings

After the molds are shaken out the castings are ready to be cleaned in a building south of the steel foundry which is entirely devoted to this work, after which they are subjected to the usual heat treatment for manganese steel. This consists of heating the castings to a temperature of about 1800 degrees for approximately 8 to 20 hours depending on the size and shape of castings, followed by quenching in water. The equipment for heating and quenching is decidedly novel.

The cleaned castings are placed on oven cars, the front doors of the ovens resting on one end of the cars. Each of the two ovens is about 6 feet wide by 14 feet long and is hand fired with coal. The temperature of each is registered by electric pyrometer recorders in the office of the company metallurgist. When the castings are ready to be taken from one of the ovens, a steel cable is hooked to the car and it is slowly drawn out by means of a power drum.

As the car is drawn from the furnace it runs on a track pivoted longitudinally over the quenching tank shown in Fig. 10. As the car nears its position on the tilting portion of the track a workman throws a lever which raises two hook-shaped castings to a vertical position, where they engage the axles of the car, which is held tight against the hooks by the tension of the cable. The car being securely clamped to the track, air is admitted to an air cylinder underneath, the rising piston of which tilts the track to an angle of about 45 degrees, where further tilting is prevented by wooden stops. The rapid tilting of track and car causes the castings to slide off into the quenching tank, which is filled with water. The castings are recovered by means of a traveling crane which spans the tank and is operated from a nearby control station.

Each Ladle of Metal is Analyzed

In order to keep a close check on the chemical composition of the steel, the metal of each ladle is completely analyzed in the well-equipped laboratory maintained by the Marion company. Test bars are taken from each ladle tapped from each heat, and carry the date and heat number for identification. Each test bar remains with the castings throughout the heat treating process, after which it is tested for physical properties. In case a defect is revealed by the testing of a bar, all of the castings poured from the heat are again heat treated. Another test for physical properties is made and if no defects are revealed the castings are considered satisfactory for use. In case the test indicates that undesirable qualities still are present, the entire heat is thrown out.

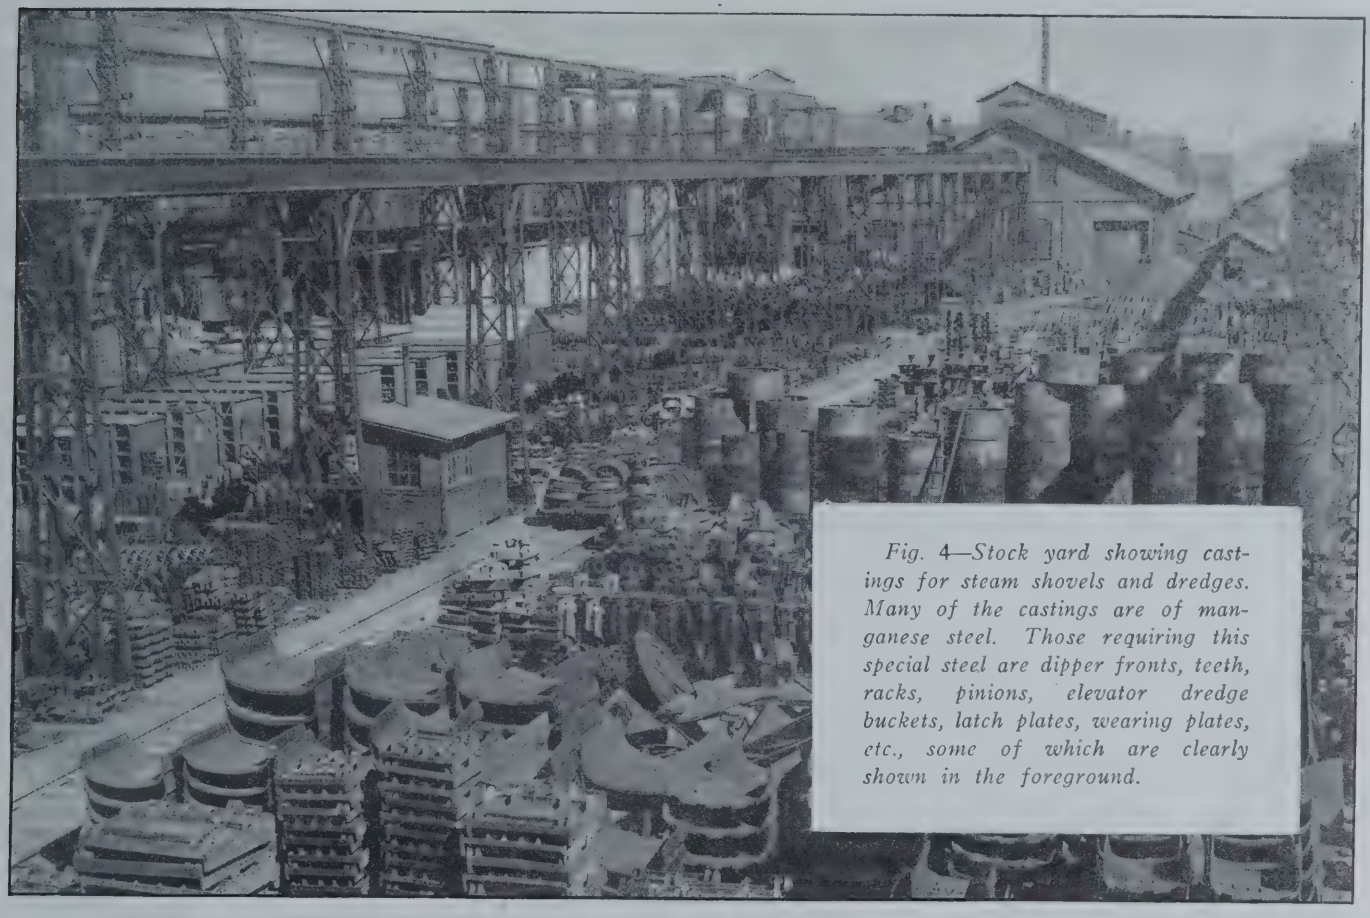

Fig. 4—Stock yard showing castings for steam shovels and dredges. Many of the castings are of manganese steel. Those requiring this special steel are dipper fronts, teeth, racks, pinions, elevator dredge buckets, latch plates, wearing plates, etc., some of which are clearly shown in the foreground.

Believe Process More Economical

Although comparative costs of the bessemer and open-hearth processes for making manganese steel are not available, the estimates made by the company based upon melting losses indicate that the open-hearth process is as economical if not more so than

FIGS. 5-8—VIEWS IN LABORATORY OF MARION STEAM SHOVEL CO., WHERE STEEL IS ANALYZED AND TEST BARS TESTED FOR PHYSICAL PROPERTIES

the more generally used converter method.

The steel foundry of the Marion company is in charge of Marshall Post, and the laboratory work and all problems pertaining to the metallurgy of metals are under the direction of Ralph Young, metallurgist.

Production of Domestic Manganese Declines

Statistics compiled by the United States geological survey for the first six months of 1919, show that both the production and demand for domestic manganese ore has fallen off considerably and is still declining. Reports received from shippers during this period show that shipments of high grade ore amounted to 44,539 tons, which was less than the amount shipped during the first quarter of 1918, when 55,682 tons were carried. The number of shippers of this grade of ore was 30 whereas in 1918 the number totaled 247.

The total shipments of low grade ore containing from 10 to 25 per cent of manganese during the period, was 86,158 tons and, but 16,871 tons of ore containing from five to 10 per cent were shipped.

Practically all the ore was shipped under contracts made in 1918 and which expired July 1, 1919. Only a few of those who shipped during the six months, which ended June 30, expect to make shipments during the third quarter of the year.

Montana contributed more than one-third of the high grade ore shipped, shipping 16,026 tons. Colorado shipped the second largest quantity and California the third. Practically half the ore containing from 10 to 35 per cent manganese came from Nevada. Total shipments from this state were 40,710 tons. The Cuyuna range in Minnesota shipped only 8220 tons.

Imports of manganese ore during this period were 225,985 tons, of which 172,996 tons came from Brazil, 33,013 tons from Cuba and 5574 tons from Costa Rica.

Producing Potash From Blast Furnace Gas

Data collected by the bureau of soils, United States department of agriculture, show that, with a new electrical precipitation apparatus for treating blast-furnace gases, about 90 per cent of the potash carried along in the dust or as a fume in the gas stream can be collected in a product containing from 5 to 30 per cent total potash of which 80 per cent is readily water soluble. In other words, if the average charge contains 12 pounds of potash per ton of pig iron, about six pounds or about 50 per cent can be recovered as readily water soluble.

Very little of this volatilized potash is recovered by the present methods of handling, the gases, either using them directly in the stoves and boilers or passing them first through washers and scrubbers before utilizing them in the stoves, boilers, or gas engines. Most of it is lost in the water with which the gases are washed in the primary or secondary washers and a large proportion is actually discharged into the atmosphere. It is claimed that little operation charges can be placed against the apparatus and therefor it is expected that potash will be produced at such a favorable price that it may enter competition with the supply from German or other sources.

Foundry Organizations in Germany Unite

The Verein Deutscher Eisengiessereien in its general meeting, held recently at Dusseldorf, has announced the fusion of the foundry syndicate Giessereiverband with the Germany Foundry union, which now counts a thousand adherents.

The foundry industry of Germany will thus be represented by a single economic organization. The union proposes to aid the foundries not only by the labors of its central trade committee but by the activities of a technical council.

A memorial of Alfred Seidel, Chemnitz, establishes the basis of a system which shall give a definite coefficient or formula for computing overhead charges tending to lead to price uniformity, a feature hitherto lacking among the scattered foundry elements of Germany.

FIG. 10—OVEN CAR ON PIVOTED TRACK DIRECTLY OVER THE QUENCHING TANK. AFTER CAR IS ANCHORED TO TRACK BY HOOK OVER AXLES, TRACK AND CAR ARE TILTED TO ANGLE OF 45 DEGREES WHICH IS SUFFICIENT TO HURL ALL CASTINGS INTO BATH SIMULTANEOUSLY

Producing Electric Steel Castings

Flexibility of This Melting Medium Recommends it to the Jobbing Foundry as Well as the Large Manufacturer—It Will Place Steel in the Ladle for From $35 to $40 a Ton

BY R. C. GOSROW

INITIALLY, the intention to engage in the manufacture of electric steel castings is influenced by several important factors. The question is frequently studied from a purely remunerative standpoint. Then comes the consideration of the ease and dependability with which the electric furnace will make steel to meet the present rigid requirements of specifications for engineering materials which demand material of high grade and of a reliable and uniform character. The installation of an electric furnace for making steel appeals in one way to the manufacturer having an established plant, producing a finished machine or other product and not engaging in making castings for other firms. But it has a different aspect to the foundryman doing a jobbing business in a district producing large machinery, and requiring large castings of reliable material. Again the electric furnace appeals in a different way to the man in charge of a jobbing foundry in a district producing machinery requiring mainly small castings.

We may then analyze the utilization of the electric steel and iron furnace, for foundry use, somewhat as follows:

A steel foundry connected with a large manufacturing plant producing castings for its own use only: Making heavy machinery castings. Making light machinery castings such as automobile truck and agricultural machinery parts.

A steel foundry doing a jobbing business only: Making heavy castings principally; making light castings principally; making heavy and light castings simultaneously.

Let us consider a foundry operating in a certain territory and supplying large steel castings, up to 40,000 pounds in weight, for locomotives, ships, railroad equipment, industrial, and steel mill machinery, etc. The furnace which such a foundry would require would have a capacity of at least 50,000 pounds, which would mean a rated 25-ton unit. For making low-carbon steel castings under specifications calling for 60,000 to 70,000 pounds per square inch tensile strength, with 45 per cent of the ultimate in elastic limit; 18 per cent elongation in 2 inches, and 25 per cent reduction of area, a duplex process using the open-hearth and the electric furnace could be adapted. The cold scrap would be melted in the open-hearth furnace and the electric furnace would then act as a basic finishing unit, to desulphurize, deoxidize, degasify, and recarburize, and also to fix the steel's composition. If acid operations were carried on, the electric furnace unit would function as a deoxidizing, recarburizing and degasifying unit, and also for fixing the composition of the steel. With the regularity of such operations, electric furnace operating costs would be maintained at a minimum, and electric furnace maintenance costs would be exceptionally low, as referred to refractories and electrodes. This practice has been followed in several plants in this country.

In order to utilize the electric furnace in a duplexing process on steel, certain advantages must be guaranteed and demonstrated. Advantage is found in being able to melt the scrap steel in the open-hearth, by gas or oil, in large quantities, and maintain a reservoir of metal molten at all times to feed the electric furnace. As longer time is required to finish steel in the open-hearth furnace than in the electric furnace, more heats may be finished and more castings poured if the metal is transferred to the electric furnace for finishing as soon as being melted in the open-hearth furnace. Again, the metal from an open-hearth furnace of 100 tons capacity may be split up into four or five steel heats of different compositions if transferred to the electric furnace, should this be desired. Another advantage is that hotter heats may be made in the electric furnace, thus eliminating the occurence of cold shuts and misrun castings, and decreasing the weight of ladle skulls. The hotter the metal the more completely may it be degasified, which concerns the elimination of entrained air, with its oxygen and nitrogen contents. By charging hot metal to the electric furnace, current fluctuations are reduced to a negligible item, and the frequent power surges attending cold melting are absent, thus making a good power load. With the hot metal charge, the furnace builds up its electrical load rapidly, and the desulphurizing and deoxidizing slag may be made without delay after the metal is charged. The interval of time between heats, from tapping of one heat to the charging of the next, is not lost. Few agencies are so destructive to highly heated refractories, acid or basic, as the sudden chilling when a furnace is tapped and cold metal charged at once. Hot metal charging would considerably eliminate this difficulty and reduce the cooling interval between heats. Another advantage of the duplexing process, under the present consideration, is the decreased amount of molding floor space required owing to the fact that pouring would take place more frequently.

A plant with such equipment could readily switch its electric furnace over to producing gray-iron castings. In this case the iron scrap would be charged cold into the electric furnace for melting; or a duplexing process with a cupola could be used. The addition of a cupola to such a plant, would give the most flexible operating conditions desired. The products of such a plant could constitute castings of duplex electric steel, duplex electric gray-iron, prime electric steel, or prime electric gray-iron. This outline then would cover the

Electricity Appraised

WONDERS accomplished by electricity have been so startling that a glamor is cast about the word and any operation associated with it is likely to be overestimated in its results. This was true of the electric furnace process for making steel. When first introduced, extravagant claims were made for the product and, to some extent, in regard to the metallurgical reactions which take place in the furnace. Mr. Gosrow has tabulated data from a number of tensile tests which show what may be expected from a low-carbon steel made in the electric furnace. He also outlines the metallurgical reactions which take place and explains the reasons for the different effects, showing that an oxidizing atmosphere is necessary to remove phosphorus and a reducing atmosphere is required to free the steel from sulphur. Under both of these conditions a lime slag is essential and these reactions are therefore confined to the operation of the basic lined electric furnace.

operations of a plant making large castings only and installing the largest, most economically sized electric furnace.

A foundry producing only light castings would encounter a different set of conditions from the case above cited. The production of small castings from a few ounces up to 1500 pounds in weight means large molding floor space. A unit of the most efficient capacity to consistently keep pace with the production demands of the shop must be installed. The furnace should be kept operating and the molders should not be interfered with for lack of floor space. For the most flexible operation, a furnace should be installed which will have about 25 per cent additional capacity, over the anticipated maximum production demand. This would give a unit which would be economical during minimum production, yet large enough to produce a maximum, both in daily tonnage and unit heat poured.

Small Furnace Recommended

As the productoin of small castings requires hot heats, and not too large heats, the desirable medium would be a furnace of one to three tons capacity. Such a furnace operating with an acid bottom should melt and finish a heat in 2 hours on the average; while for basic operation 2½ to 3½ hours would be an average. These figures are based on both operations producing 0.25 per cent carbon steel castings, with sulphur and phosphorus in acid practice each 0.07 per cent maximum, and in basic 0.04 per cent maximum.

The most economical grade of scrap to use would be 80 per cent of the charge in clean, coarse, heavy turnings, with 20 per cent of the charge foundry sprues; or about 10 per cent sprues and 10 per cent drop forge crop ends and tong holds. These materials melt up rapidly and may be charged easier than most other grades of scrap materials. Heavy materials should be avoided, as they are charged slower, and require more time to melt. In small furnaces heavy chunks of scrap destroy the door sills, banks and hearth. By operating 1½ to 3-ton furnaces, pouring the metal from the furnace to a bull ladle, then shanking off in 150-pound pots, the furnace is never held idle for long periods to pour off, as is usual when shanking is done direct from the furnace.

While it is true that the rapid heating and cooling of the lining in small, fast operated furnaces is deteriorating on the refractories, it cannot be prevented when cold charging is practiced. Yet considering the weight of the lining material and the heat stored up in it, compared to the weight of the cold metal charged, it can be seen that the deteriorating effect of heating and cooling would not be as great in a 3-ton furnace as it would be in a 10 or 25-ton unit. Besides it would not be practical to run a mixer in connection with a 3-ton, or smaller unit. Cold charging is therefore the preferable method for smaller furnaces.

By installing a furnace with an automatic electrode control, with mechanism to tilt back for slag skimming and forward for pouring the metal, a labor-operating crew consisting of one man can tend the furnace, except at charging time, when two additional men would be required for short intervals. A 1½-ton furnace operating by acid process, should melt and finish a heat with an energy consumption of not over 650 kilowatt hours per ton poured, while a 3-ton furnace should get out a heat with not over 600 kilowatt-hours per ton poured. On basic operation these figures would average 50 to 100 kilowatt-hours greater per ton poured. These figures pertain, of course, to plain carbon steel castings.

Frequently a large manufacturing concern engages in the production of the steel castings which enter into the manufacture of its final product while many users of steel castings, although they have foundries to produce gray-iron and brass castings for their own needs, purchase steel castings from other firms. This brings up the question of the advisability for a firm to make its own steel castings.

Production of steel castings in a large manufacturing institution, means another department for the management to handle. It means a new organization in a plant which may already be over organized and too integrated. Then should there come a business depression the steel foundry would have to suffer; it would be necessary to lay off men, the machinery and equipment would stand idle, and the organization be broken up. These factors in turn affect other departments of the same plant. The purchase of materials for the steel foundry puts additional strain on the purchasing department and adds to the large variety of material with which the department must be familiar. The installation of a steel foundry would also require an investment in buildings, equipment, supplies, etc., and the interest and

Table I

Cost of Net Ton of Electric Steel in Ladle*

Item	Pounds	Unit cost	Cost per 2000 lbs. metal 1½ ton	3 ton
Turnings .....5% loss	1680	$15.00 net ton	$12.60	$12.60

Insurance, etc.			0.04	0.04
Total cost per net ton of metal in the ladle			$39.55	$35.31

*Steel composition desired:

Carbon	0.22—0.28 per cent.
Manganese	0.55—0.70 per cent.
Silicon	0.40—0.55 per cent.
Sulphur	0.045 per cent maximum.
Phosphorous	0.040 per cent maximum.

Furnace capacity per unit heat and production:
Producing from 1½ ton unit, 9 heats, 13½ tons.
Producing from 3 ton unit, 7 heats, 21 tons.

Power capacity of furnaces:
1½ ton; 600 KVA.
3 ton; 1000 KVA.

Scrap melted:
Steel turnings, 80% of charge. 0.20—0.30 carbon.
Foundry sprue 20% of charge, 0.20—0.30 carbon.

depreciation charges would have to be met by the profits of the steel foundry.

It would appear, however, in spite of the foregoing arguments against it, that a steel foundry would be a paying investment for many concerns. The quantity of scrap material accumulating is considerable in any large manufacturing plant and a big portion of this scrap is steel. The scrap steel of course, is sold at good or poor prices, depending on the market, and directly bears on the prices paid for new materials. However, the manufacturer might convert it into a product for which he pays good prices when buying his castings, if he established his own steel foundry.

In the large manufacturing plant considerable accessory equipment could be utilized in operating a steel foundry. Such equipment already in the plant and which is needed for a steel foundry would consist of water pumping machinery, air compressors, transformers for power and lighting circuits, spur trackage, industrial trackage, yard cranes for unloading raw materials and handling the castings, fire protection systems and shops in which its own equipment may be made and repaired. Engineers of wide experience, an efficient employment department, trained office help with a systematized method of keeping accounts, and usually good financial support are among the other advantages which a large organization offers for adding another unit to its plant.

A large machinery manufacturer would undoubtedly require castings of a wide range of weight and would have to equip his foundry to make the largest as well as the smallest castings which would be needed. For economy he should keep his furnace running continually and produce all his work, both heavy and light. This condition would be a hardship on the foundry. At times it would have a surplus of heavy work to turn out quickly, and at other times a majority of light work. In order to take care of the fluctuations it would be necessary to over-man his foundry. This condition would be undesirable as well as unprofitable. However, the difficulty, in many cases, might be somewhat obviated by running the foundry to produce castings for stock.

Advantage in Regular Production

Manufacturers of parts for automobiles, trucks, tractors, agricultural machinery, rock and ore crushing machinery, and other similar lines could advantageously introduce the electric furnace. The universal use of such machinery, guarantees to the manufacturer a continual market for his product. With the quantities of castings required daily a steady, never failing production must be maintained. This means that the electric furnace could be maintained at maximum production. Such a manufacturing plant would enjoy a considerable advantage in producing its own castings. In the first place a desirable supply of turnings, etc., would accumulate for an electric furnace charge from the quantity of material machined. Then, too, the foundry practice could be improved and standardized through studying results and investigating their causes. At the same time improvement could be made in the grade, composition, and quality of the steel.

The manufacturer of machinery, as previously stated, uses many gray-iron as well as steel castings in his machines. The flexibility of operation of a well designed and equipped electric furnace should appeal strongly to such manufacturers. By operating the electric furnace for producing gray-iron and steel castings, by basic or acid processes, a unit would be at hand which would produce castings of the highest physical properties, and at the same time replace a cupola for iron, and a converter or crucibles for steel.

An electric furnace for such requirements would be most suitable in a 1½ to 3-ton unit. In a furnace of such capacity, repairs to the refractories could be quickly made. Quick heats could be produced of such a size that the chemical composition could be closely controlled and changed readily when desired.

A Study of Costs

Back of all the arguments pro and con is the cost question. If the cost were excessive it would bar the electric furnace. But it has been proved that electric furnace steel costs are not excessive. In Table I figures are given showing the cost of producing one net ton of 0.25 per cent carbon basic steel in the ladle.

From this estimate, which it is safe to state is not over 10 per cent plus or minus from actual foundry costs in manufacturing centers of this country, it may be seen that there is not a wide difference of costs between the two sizes of furnace providing both are run to normal capacity. The ultimate cost of electric furnace steel in the ladle is lower than the cost of other methods of producing the same analysis steel in the same unit quantities. The reasons are:

Less oxidation losses of metal in melting down the charge.

A less gasified steel, not requiring as much time to finish the heat.

A steel containing less oxygen and oxides, thus not requiring the quantities of silicon for deoxidizing.

A less oxidized steel, consequently more economy in the use of manganese and other alloys, otherwise lost by oxidation.

A more fluid steel, thus giving homogeneity and better absorption of the alloys added.

Production of a hot metal and thus eliminating cold shuts and misrun castings.

The ease of manipulation and control of the electric furnace, decreases labor needed to operate it.

Producing quick, small heats: The foundry can be operated more

economically when casting is going on at regular intervals all day.

The ability to carefully control the analysis desired eliminates loss by off heats and scrap castings.

Money is saved on interest and investment by using a small unit, producing several heats per day, than by using a large unit or greater unit production, but less heats per day.

Electric Companies a Factor

While the electric furnace has developed in favor among foundry and mill men, its advance would have been seriously impeded and delayed if it had not been fostered and backed by the power generating companies. Through the loyal and scientific cooperation of generating and distributing electrical engineers, metallurgists and foundrymen, the electric furnace has developed to be an apparatus favored and promoted by all three of these interested groups.

Initially when electric furnace loads were put on some of the power company's lines, it became apparent that certain refinements were necessary to safeguard other customers taking power from the same lines. Then, also, it was found that an electric furnace load on a small feeder system caused too great fluctuations of power. Where favorable conditions warranted it, power company lines were consolidated to feed through a larger system and thus take care of an urgent demand from customers who were installing electric furnaces. But now with the three-phase furnaces in operation, having regulating and safety devices, the power companies are anxious to get such customers. As most of the heavy peak loads of the generating companies come during the morning and evening hours, the hours of the night and day present periods of surplus power available. If a manufacturer can regulate his output so as to refrain from operating the furnace during peak load periods, he can secure concessions in his power rate. The ease with which an electric furnace may be started and heated up makes this practice of operating the furnace on off-peak periods practical, and the furnace need be shut down only about 6 hours out of 24 hours. This schedule, of course, pertains to the foundryman who has a large tonnage to produce, and who operates his plant on a 24-hour day schedule, which practice is followed in some plants throughout the country.

At the present time, various large electric generating and distributing systems require that electric furnaces on their lines shall be three-phase furnaces. This is to eliminate the unbalancing and overload on their feeder lines and generators, caused by single phase units, with their resultant low power factor. When electric furnaces first came into use single-phase furnaces were tolerated by the power companies. But with the increasing application of the electric furnace, and the large loads which are required, the single-phase units became undesirable, and today some power companies require, before issuing a power contract, that a three-phase furnace be installed.

The objection is often made among buyers of electric energy for electric furnace use, that their unit energy charges are not consistent, or that one has a lower unit rate than another. The amount of money paid for electric energy is derived from and figured on how much energy is used per month, and when it is used during the 24-hour day. An example of the method of calculating rates of charge are illustrated in Table II. Calculations are given of two furnaces with different demand charges and varying energy consumption. The demand charge is a charge for capacity and is based on the largest amount of power the furnace will take. This is merely a charge by the electric company for standing ready to deliver power of a stated number of kilowatts. The consumption charge, on the other hand, is for power actually used. The figures in Table II show clearly the effect of a low energy charge with a high demand. The furnace in plant *A* was not running near to capacity. It was also running slow, as evidenced by the time to make three heats. The furnace in plant *B* was running nearer to capacity and had a higher demand but also a much greater energy consumption which made the charge per kilowatt hour less for plant *B* than for *A*.

When using the electric steel furnace for manufacturing castings, it must not be assumed, that any aggregate of poor materials will produce the highest grades of steel. It must also be remembered that an electric steel furnace is not a cure for all troubles with steel and castings. The electric steel furnace is a high class piece of steelmaking apparatus and must be intelligently used and operated. Only in this way can the economies and high grade product claimed for it be realized. The proper grade and physical condition of raw materials also must be considered.

For producing acid carbon steel castings, an electric furnace may be most efficiently operated with a rapid output of heats. But the raw material available would determine whether it would be advisable to use this process instead of the basic process. Scrap for acid steel castings should not contain more than 0.045 per cent sulphur and phosphorus as there is always an increase of sulphur and phosphorus when steel is melted in an acid-lined furnace. A 0.06 per cent sulphur and phosphorus content should be the high limit for steel made by the acid process. As the increase in percentage of sulphur and phosphorus in the final metal is due to the oxidation of iron in melting down, the electric furnace acid operation does not cause as high an increase in the percentage of these elements as does the open-hearth with its greater oxidation losses. The scrap selected should also be physically clean and free from sand, scale, rust, and refuse, such as shop sweepings.

Table III

Tensile Tests of Basic Electric Steel

Test number	A	B	C	D	E	F
Carbon	0.49	.44	.41	.39	.53	.31
Manganese	0.51	.56	.66	.65	.66	.61
Silicon	0.26	.37	.33	.37	.33	.59
Sulphur	0.041	.043	.047	.045	.047	.035
Phosphorus	0.036	.035	.042	.044	.043	.035
Utimate strength, lbs. sq. in.	93,000	84,000	83,400	85,300	103,500	84,400
Elastic limit, lbs. sq. in.	44,500	42,800	44,000	45,300	48,300	44,500
Per cent elongation in 2"	17.0	17.2	18.5	19.0	16.5	18.2
Reduction of area; per cent	20.2	20.1	23.8	24.1	20.0	21.8

The purpose in melting steel in a furnace with basic hearth and banks is to oxidize the phosphorus, and then combine the phosphorus pentoxide produced with lime. These form a calcium phosphate which is held in the slag. The conditions for good dephosphorizing must be oxidizing, with an excess of lime present in the slag. In the acid operation of melting, oxidation takes place, but a phosphate of iron is formed instead of calcium phosphate because there is no lime present to unite with the phosphorus pentoxide. The first slag that forms in the acid furnace is a black, glassy silicate of iron with some iron phosphate. This phosphate of iron is easily reduced and the phosphorus goes back into the metal and none is carried away by the slag.

During the final period in which the steel is refined the atmosphere over the metal is decidedly neutral and reducing in character. The term refining generally implies basic operation, but it may technically mean the finishing and completion of the steel, either in basic or

acid operations. In the acid process refining might be considered to consist of the elimination of gases, solid oxides and slag from the metal. The operation also includes securing the desired composition of the metal by the addition of alloys, etc. In the basic process, refining constitutes the elimination of sulphur, gases, solid oxides and slag, and final fixing of the chemical composition. The elimination of sulphur is the one element of operation which strongly distinguishes it from acid operations. As desulphurizing of steel in the basic process is a series of chemical reactions, the proper conditions must be maintained to achieve the result. Primarily, desulphurization is a reducing process. When the metal is melted and after the first ferrous-lime slag is removed, the steel is contaminated with oxides, both solid and gaseous. Although the metal is melted it is not in its most fluid quiescent state. At this stage lime is added, along with carbon, for the purpose of forming a carbide of lime on the surface of the metal. This combines with any silica present and forms a slag. As carbide of lime, or calcium carbide, is a strong reducing agent, the sulphur of the iron sulphide in the slag combines with the calcium and forms calcium sulphide, which goes into the slag as a very liquid compound. The oxygen in the solid and gaseous oxides present, combines with the carbon and forms carbon monoxide and carbon dioxide, which go off as gas. The iron oxide in the metal has now been reduced to iron, the oxygen has passed off as an oxide of carbon, and some of the sulphur is in the slag, combined with calcium. In the acid process this procedure does not follow, because it is impractical to add a strong base, such as lime, to a strong acid refractory, like silica. So in the acid process desulphurizing is not carried out, and better grades of scrap are necessary to make a final metal sufficiently low in this element.

As the uniform physical properties of a metal depend on its homogeneity, it would appear primarily essential that electric steel be homogeneous. When properly made from suitable materials, steel from the electric furnace is homogeneous. Heterogeneity is due to unsatisfactory and poorly selected raw materials, haste and lack of skill in operations, and a misunderstanding or ignorance of what the electric furnace requires in producing the high grade product it is capable of making. As an indication of the quality of such steel the results of some tensile tests of basic electric steel, after it had been annealed, are given in Table III which is shown on page 1709.

Welding Large Mill Engine Cylinders

BY L. M. MALCHER

TWO weeks after the signing of the armistice, one of the big steel rolling-mill engines of the Carnegie Steel Co., Farrell, Pa., which had been working steadily on war orders, broke down with the result that its service had to discontinue entirely. As a result of the breaking of a connecting rod at the point of reversal, the left-hand low-pressure steam cylinder of this engine—an Allis-Chalmers twin tandem-compound, reversing—was badly fractured besides several other parts being injured. The cylinder, shown in the accompanying illustrations, has an inside diameter of 70 inches. To obtain a new cylinder would require about 3½ months and while the engine was out of operation, 360 men would be thrown out of employment. Thus, in order to place the mill in operation as soon as possible and to prevent laying off employes, it seemed that a repair was the only solution. After oxyacetylene welding was decided upon as the method to be used, the Oxweld Acetylene Co., Chicago, was called upon to do the work. Three expert welders with the necessary equipment went at once to Farrell to undertake the job of repairing the unit. With much success, the task progressed until it reached completion although at times a few difficulties arose to hinder the work. The total time required to finish the repair of the broken cylinder was 72 hours, which included the operations of chipping, preheating and welding. While dismantling he engine to have access to the low-pressure cylinder, a fracture was discovered in the 42-inch right-hand high-pressure cylinder. Welding this fracture required about 18 hours. Seven days from the time the welders were given

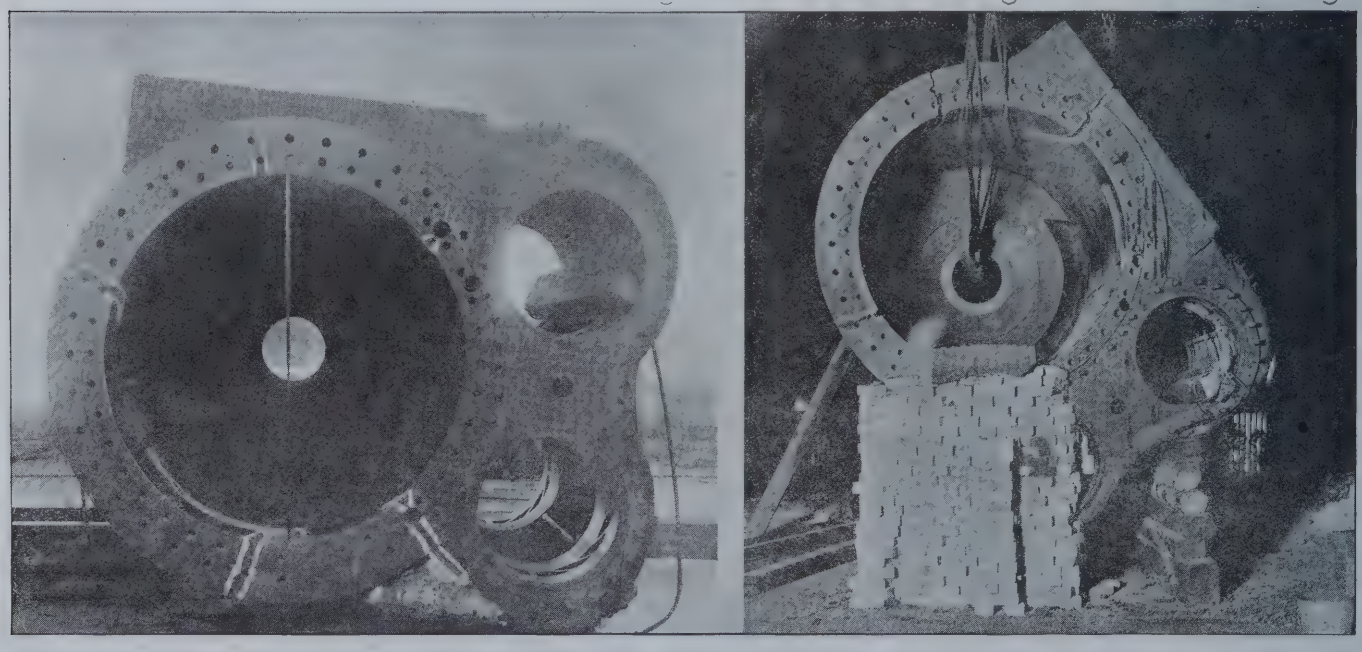

FIG. 1—WRECKED LOW-PRESSURE CYLINDER SHOWING THE CRACKS V-GROOVED BY CHIPPING PREPARATORY TO WELDING. FIG. 2—PREHEATING A CRACK IN THE LOW-PRESSURE CYLINDER WITH A CHARCOAL FIRE. THE CASTING WAS HANDLED BY CRANE

Flux consumed, pounds	25
Period of welding shifts, minutes	10 and 30
Number of welders	3

the order for the work, the entire task was finished. In Table I is given data as to the size of the casting welded, the amount of material required and the time required for the different operations in repairing the low-pressure cylinder. Similar information for the high pressure cylinder is given in Table II.

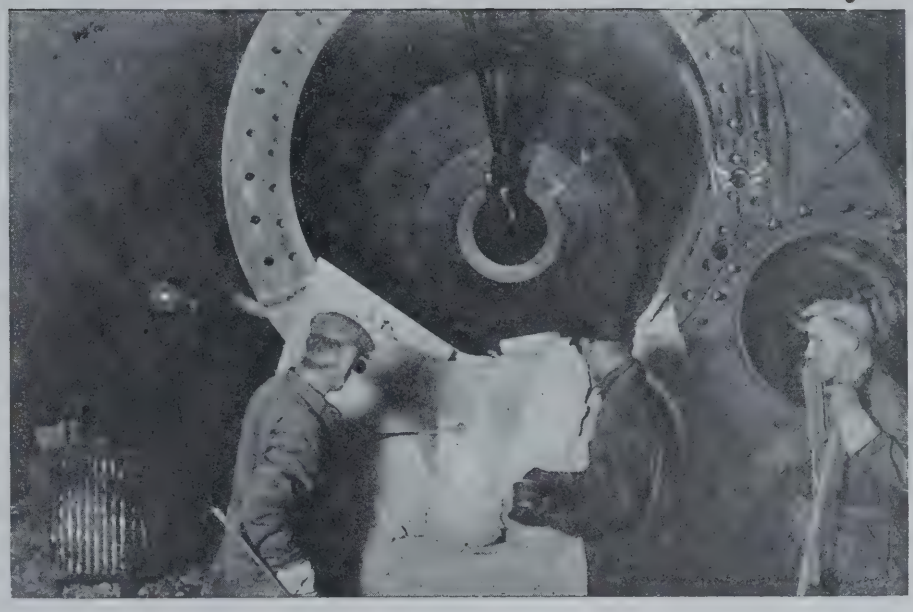

FIG. 4—WELDING THE LOW-PRESSURE CYLINDER —ASBESTOS PAPER WAS USED TO PROTECT THE WORKERS

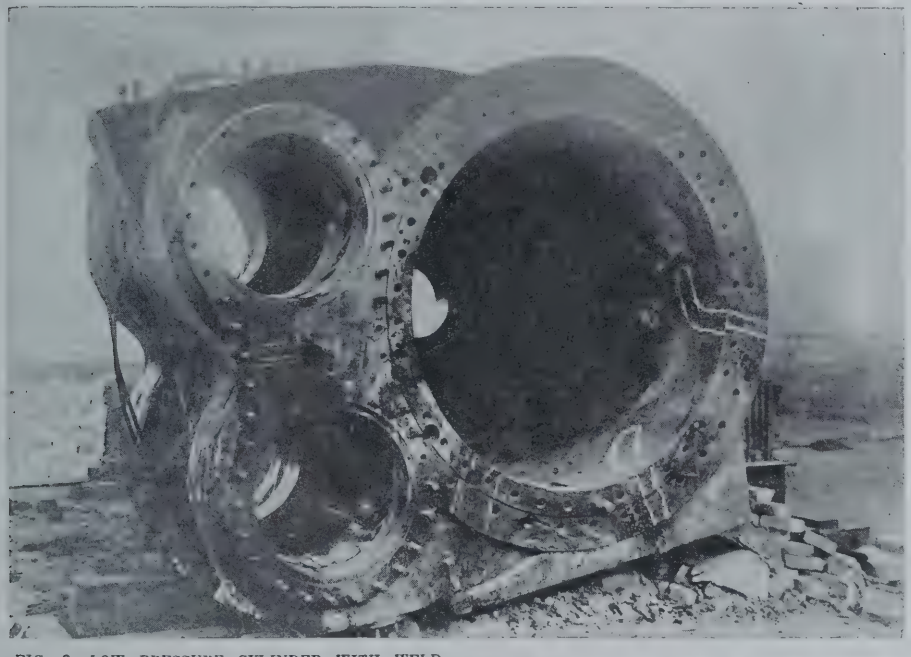

FIG. 3—LOW PRESSURE CYLINDER WITH WELDING COMPLETE—THE WELDS WERE FROM 1 TO 8 FEET LONG

The engine has a 5000-horsepower rating and is designed to give its maximum power while rolling and running at from 100 to about 110 revolutions per minute.

Welders Work in Shifts

While welding inside of the cylinder castings, the operators were forced to relieve each other every 10 minutes because of the intense heat reflected back on them, but while working on the outside the heat was not so intense and one man was able to work 30 minutes before requiring relief. After the cylinders were machined, it is said, it was almost impossible to determine where the cracks had been. Not only did the repair job make it possible to resume operation of the engine at an earlier date but the cost of repair was a small fraction of the replacement.

Reducing Grinding Wheel Failure

Breakage of Wheels Under Operation is Due to One or More of Nine Causes — Carelessness of Operators Contributes Largely to Failures — Proper Mounting of Wheels is Important

BY HAROLD E. JENKS

GRINDING wheel breakage is a subject which directly concerns wheel consumers as well as manufacturers. In order to reduce breakage to a minimum certain underlying causes should be clearly understood.

Breakage of grinding wheels while in operation may be due to any one or to a combination of two or more of the following causes:

Centrifugal force due to rotation of the wheel; direct pressure exerted by the work on the wheel; heating of the wheel or spindle; grinding on the side of the wheel (side pressure); improper mounting; impact on the side or face of the wheel; cracks or flaws in the wheel structure; lack of balance; and initial stresses.

It is unavoidable that these causes should overlap to some extent; for instance, heating of the wheel is a result of direct pressure by the work. It is thought, however, that the list has been condensed as much as possible to still retain the desirable property of clearness.

By "stress," as used here, is meant force acting between the particles of wheel material per unit of area. Wheel material is much weaker under tensile stress than under compressive stress and for this reason, stresses are herein specified as tensile or compressive, it being understood that compressive stresses are not important as sources of breakage.

Much importance should be attached to the fact that although not one of the existing stresses in a wheel may be excessive, the combination or resultant of two or more of them may be sufficient to cause breakage.

Breakage from Centrifugal Force

In a grinding wheel stresses due to centrifugal force are of two kinds and consist of a radial stress acting in the direction of the radius of the wheel and a tangential stress acting in a direction perpendicular to the radius. Both stresses are tensile. The tangential stress is much the larger of the two, and reaches its greatest value at the inside of the wheel—that is, around the circumference of the hole.

The radial stress has its maximum at a point from one-third to three-fourths the distance from the face of the wheel to the hole. The amounts of both stresses vary as the square of the wheel speed, which means that if the speed is doubled the stresses are quadrupled. For a given peripheral speed and diameter of wheel, the maximum tangential stress increases slightly as the diameter of the hole is made larger, and in cylinder wheels becomes about 20 per cent greater than in disc wheels with ordinary sized holes.

Why Wheels Break

Grinding wheels in operation may break as a result of any one or of a combination of two or more of the following causes:

1. *Centrifugal force due to rotation of the wheel.*
2. *Direct pressure exerted by the work on the wheel.*
3. *Heating of the wheel or spindle.*
4. *Grinding on the side of the wheel (side pressure).*
5. *Improper mounting.*
6. *Impact on the side or face of the wheel.*
7. *Cracks or flaws in the wheel structure.*
8. *Lack of balance.*
9. *Initial stresses.*

Since a grinding wheel in operation is always revolving, stresses due to centrifugal force always exist; and although it is probable that comparatively few wheels in operation break from these stresses alone, others may easily combine with them and produce breakage.

Reliable grinding wheel manufacturers test all wheels before they leave the factory by running them at such speeds that the minimum safety factor is 2½ and the maximum in some cases as high as 5. As a result of this precaution, practically all breakages that occur from centrifugal force alone can be traced to such causes as shifting thoughtlessly from large to small pulleys, placing large wheels on spindles running at speeds intended for small ones, or substituting for a wheel running at the correct speed one of different grain and grade and lower recommended wheel speed. In other words, these breakages are nearly all due to carelessness or ignorance on the part of the operator.

Effect of Excess Direct Pressure

By "direct pressure" is meant pressure on the face of a wheel directed toward its center. Stresses produced by this pressure are radial and tangential, or frictional.

The radial stress is the same as would be produced by direct pressure, if the wheel were not revolving, and is compressive. It is usually small in amount and is unimportant as a cause of breakage.

Contact between the particles of the revolving wheel and the work produces a frictional force whose amount is proportional to the direct pressure and which is in the direction of a tangent to the wheel face. This force causes bending stresses along a diametral section of the wheel which are tensile on one side of the center and compressive on the other. These stresses reach their largest value at the face of the wheel, and are usually small and unimportant.

Heating of the Wheel or Spindle

Considerable heat is developed at the point of contact of wheel and work, and in cases where grinding is done dry the wheel may become very hot. The stresses produced by unequal expansion of different parts of the wheel may in this case reach a large value, and many breakages probably are due to this cause. These stresses are similar to those resulting from centrifugal force and may vary greatly in amount according to variations in temperature of the wheel. An exact determination of their amount is difficult, if not impossible. The greatest tensile stress occurs around the circumference of

From *Grits and Grinds*, November, 1919, published by Norton Co., Worcester, Mass.

the hole and hence combines with the greatest stress due to centrifugal force.

Heating of the spindle may be produced by tight bearings on the machine; and if the wheel bushing fits the spindle tightly, expansion of the latter will cause tensile stresses of considerable magnitude in the wheel, which, adding to the maximum stress due to centrifugal force, may cause breakage.

Side Pressure Causes Wheel Failures

Many breakages are directly caused by side pressure, which occurs to a limited extent when work is being traversed across the face of the wheel, but principally when grinding is done on its side. Also, particularly in snagging operations, large side pressure may be produced by grinding on or working the corners of the wheel face. The effect of side pressure is to produce a bending stress whose maximum reaches all points of the wheel as it revolves, and which is tensile on the side of the wheel which sustains the pressure and compressive on the other.

Properly designed flanges used on wheels of sufficient thickness are the best protection against breakage due to side pressure. They not only greatly reduce the maximum stress due to this pressure, but prevent its attaining its maximum at the circumference of the hole, where it would otherwise combine with the maximum due to centrifugal force.

Evils of Improper Mounting

The essentials of wheel mounting provide that care be taken that the sides of the wheel and the sides of the flanges in contact with the wheel are plane surfaces, in order that an even bearing may be secured. The hole should be of a diameter approximately 0.005-inch larger than the spindle or arbor on which the wheel is to be mounted, and must be at right angles to the sides of the wheel, concentric with the circumference. No portion of the bushing should project beyond the sides of the wheel.

The spindle should be perfectly straight and threaded in a direction such that any tendency for the wheel and nut to turn will tighten the nut.

Flanges are used primarily to transmit power from the shaft to the wheel, and for this reason the inside flange must be keyed to the shaft Both flanges must have plane faces at right angles to the shaft, and should be properly relieved—that is, they should be countersunk so as to bear on the wheel only on the part of the side of the flange nearest the rim.

Blotters or some other form of compressible washers should be used between flange and wheel to insure an even bearing. Their diameter should be at least as large as that of the flanges.

The nut should be tightened only enough to properly hold the wheel. Further tightening is unnecessary and undesirable.

Stresses in the wheel due to improper mounting are particularly important because they all combine directly with the maximum due to centrifugal force.

Forcing a wheel on a spindle for which its hole is too small is extremely likely to result in breakage, as large tensile stresses are induced around the circumference of the hole. If the hole is too small, it should be carefully enlarged by scraping until a perfect fit is obtained.

Impact is Cause of Failure

Side pressure producing large tensile stresses may result from any defect in mounting which tends to produce uneven bearing between flanges and wheel, such as bent or broken flanges; projecting bushings; high spots on bearing surfaces of flanges or wheel; flanges not properly relieved; failure to use proper compresible washers; flanges of different diameters, or excessive tightening of the spindle nut.

Probably most breakages due to impact are the result of carelessness or ignorance on the part of the operator. It should be borne in mind that stresses in a wheel produced by a suddenly applied force are very much larger than those produced by the same force if applied gradually.

The impact of the particles of the wheel on the work in any form of grinding produces certain stresses in the wheel, but these are carried more by the particles in direct contact with the work than by the wheel as a whole, and are not important as a cause of breakage. Cases have been known, however, where ignorant operators, in order to increase the speed of cutting, have hacked the face of the wheel in such manner as to cause breakage due to this form of impact.

Breakages are sometimes caused by bringing heavy pieces of work into too sudden contact with either the face or side of the wheel. Carelessness in snagging castings suspended from chain hoists, for example, might easily produce breakage of this kind.

In work requiring a table traverse, the headstock or footstock may be run into the wheel, which will cause wheel breakage unless something else gives way first. This is not true impact, but approaches it on account of the suddenness of application of the force, and results in large stresses due to side pressure.

Catching of the work between the wheel and the rest in free hand operations is very likely to cause wheel breakage. Such an accident may be due to improper adjustment of the rest or to lack of attention or ignorance on the part of the operator, and may have very serious consequences. This is a true case of impact, the speed of application of the force being practically the speed of the periphery of the wheel.

Flaws in the Wheel

Wheel breakage sometimes occurs because of cracks or flaws which are in the wheel before it is put in operation. Such defects may be entirely under the surface of the wheel and therefore not visible. Flaws are manufacturing defects, while cracks may be due to faulty manufacture or to various other causes such as carelessness in transportation, handling, unpacking, or storage.

The ring of a wheel, or sound produced by its vibration when tapped lightly with some solid object, is used as one indication of interior cracks or flaws. A wheel with a clear ring is fairly certain to be free from such defects, although it has been shown that a poor ring does not necessarily mean a defective wheel.

Lack of Balance is Cause

A wheel that is out of balance has developed in it stresses of rather complex character. In cases where the lack of balance is very great, breakage may result, either from these stresses or from impact. Lack of balance may be due to several causes.

Variations in density in a wheel may cause imperfect balance. However, this can hardly prove serious in the case of wheels furnished by any reliable grinding wheel manufacturer, as the homogeneity of structure of such wheels precludes the possibility of a dangerous amount of lack of balance.

If a wheel goes out of true for any reason, it will also go out of balance, since its center of rotation will no longer be at its center of gravity. Wheels may go out of true from such causes as a bent spindle, loose bearings, loose frame, improper use, or from the hacking of the wheel face previously mentioned. If a wheel is

seriously out of true, it will deliver a series of blows to work thrust against it, thus producing large impact stresses. The stresses due to the centrifugal force of the out of balance portions of the wheel may also become large in this case and will combine with the maximum due to centrifugal force.

A wheel should not be allowed to stand partially submerged in water or other liquid, for when it is started in motion the wet portion is much heavier than any other and hence the wheel is greatly out of balance. Several cases of breakage from this cause are known.

During the process of manufacture of any solid body, initial stresses are sometimes set up in the material of which the body is composed. Unless great care is used in its manufacture, a grinding wheel may have such stresses existing in it. These may be regarded as incipient flaws or cracks and may combine with other stresses to increase the maximum stress in the wheel. No method has yet been devised for determining accurately the existence of initial stresses in wheels.

On account of the number and variety of the possible causes of wheel breakage given above, it is easily seen that the actual determination of the real cause of breakage of a single wheel may be difficult or impossible. In cases, however, where breakages occur consistently with a certain operator or on a certain machine or operation, it may be reasonably assumed that there are one or two principal causes involved which can by a study of the situation be detected and removed. This procedure will reduce wheel breakage to a minimum.

Smelting Titaniferous Ores in 1834

THAT considerable thought is being given to titaniferous ores by blast furnacemen and ore-mine operators in this country, is shown by the number of comments received by THE IRON TRADE REVIEW on one of its editorials in the Nov. 20 issue, entitled "Smelting Titanium-Bearing Ore." Dwight E. Woodbridge, Duluth, Minn., gives additional information on the tests made in 1914 at Port Henry, N. Y., and data on the methods of smelting this grade of ore in 1834, as follows:

With many of the conclusions of this article one can agree heartily, but for the sake of future clarity of discussion I want to call your attention to one error. You say that the experiments carried on in Port Henry in 1914 were with an ore of 13 per cent titanium. This ore was of about 13 per cent TiO_2, which is approximately 8 per cent titanium, instead of 13 per cent. It was used in the furnace mix to a working proportion of 4/16, as you state; this means that the furnace burden, at the time when the greatest successful proportion of titaniferous concentrate was on, carried 2 per cent titanium. At one time during the progress of this experiment the proportion of titaniferous concentrates was 5/16, but this was not for long, nor was it especially successful. Mr. Bachman, who conducted this experiment, was careful of his furnace, and did not invite disaster. One cannot know the instructions under which he worked, but if it was desired to arrive at a full knowledge of the action of titanium in the blast furnace, at limiting proportions of titanium, he should have had a free hand and an uncircumscribed purse. He did most scientific and valuable work and overturned the popular conception as to the smelting of titaniferous magnetities. The results reveal much study. But, notwithstanding that, the experiment was inconclusive. It is not the first time that a furnace has successfully smelted an ore carrying 2 per cent titanium. My recollection is that the pig iron was not high in titanium, and assayed not far from 0.65 per cent. In 1834 catalan forges and small blast furnaces were in operation in the vicinity of the ore used by Mr. Bachman, on Lake Sanford, N. Y. This ore was smelted direct with cold blast, charcoal fuel and a poor local flux without admixture of nontitaniferous ores. The operators did not know the ore had deleterious elements. However, they piled on the charcoal and made an excellent grade of iron. Not long ago some of the iron they made was assayed with this result:

Element	Per cent
Silicon	0.065
Sulphur	0.015
Phosphorus	0.060
Titanium	0.198
Vanadium	0.038
Graphitic carbon	0.025

In those days conditions existed that do not remain; the furnaces were of 2 to 5 tons daily capacity, the magnetic concentration was crude, being usually carried on in a barrel or a hollow log set around the inside with horseshoe magnets. The log was filled partially with broken ore and revolved in a stream bed. The furnaces were situated in forests where the cost of charcoal was not excessive; labor commanded $1 to $1.50 per day, payable largely in trade; and pig iron brought $50 to $70 a ton.

Such concentration as was conducted on this Lake Sanford ore was by the use of Ball-Norton type separators, the machines regularly in use at Mineville. The methods, which were followed, were based on the fact that the ore is a granular aggregate of magnetite, ilmenite and gangue, the latter being composed chiefly of silica. The fact that the magnetite contains some titanium and the ilmenite has iron as one of its integral constituents—ilmenite equals $FeTiO_3$—makes this separation a more difficult and wasteful process than might appear to one who looks on the ore and is able to distinguish with ease the difference in appearance of the two minerals. Magnetic separation cannot readily free the iron from all its titanium, nor can all the titanium be separated from its iron because ilmenite is a chemical combination that cannot be broken mechanically. Therefore, in any attempt to secure a high-grade iron ore, the tailings will be high in iron; and, in an effort to make a titanium ore, the iron is likely to be excessive.

You call attention to the fact that magnetites bearing titanium are likely to be low in phosphorus which is true. One of the great sources of low-phosphorus ores in time is sure to be this type of iron ore. With titanium less a bugbear to furnacemen, these ores will come in more quickly than otherwise, of course. In connection with the possible American supplies of these ores it is somewhat unfortunate that bureau of mines bulletin No. 64 dealing with titaniferous iron ores, does not recognize the size, character and importance of these ores existing in northeastern Minnesota, but reports them as of little consequence. As a matter of fact, Lake and Cook counties, Minnesota, and adjacent regions, are rich in these ores.

French Foundries Resume

An example of the efforts being made to again operate manufacturing establishments in France which suffered from the effects of invasion by the Germans is given in a communication recently received in this coun-

try from the management of the Metallurgical Society of Aubrives and Villerupt. The works of this society are situated at Aubrives, which is in the department of Ardennes in the valley of the Meuse, and at Villerupt, a few kilometers from Longwy in the Meuse-Moselle district. Before the war, the company was actively engaged in manufacturing cast iron pipe for water and gas, waterworks apparatus and accessories for the distribution of water, downcomers, track material, hydraulic pumps, and castings.

Owing to their location near the frontier, the plants were in the invaded district at the beginning of hostilities and with the other plants in this region suffered severely during the period of occupation. Immediately following the evacuation by the Germans and the return of the invaded property to its owners the company undertook the work of reconstruction. After considerable work, operation of the Aubrives foundries was resumed. This plant now is producing a fair tonnage and is contributing largely to the rebuilding of the devastated regions by furnishing pipe and accessory equipment for the restoration of the destroyed or damaged water service. At Villerupt the blast furnaces were destroyed during the war and the machinery and accessories which were not carried off by the Germans were destroyed. The recovery of stolen material has progressed slowly, due to the lack of adequate means of transportation and because of the numerous difficulties inherent in reorganizing the area. In spite of this damage the Villerupt foundries already have been placed in operation. At the time the communication was written the firing of the furnaces was considered only a question of days and it is expected that the society soon will be able to furnish the raw material for both of its foundries.

The society is planning to enter the export market in competition with pipe foundries which have not suffered from the war and already important orders for track equipment, etc., have been received.

Alaskan Tin Production

Production of tin in Alaska dropped from 200,000 pounds in 1917 to 136,000 pounds in 1918, according to a bulletin recently issued by the United States geological survey. The value of the 1918 output was $118,000, while that of the 1917 production was $123,300. The bulletin states that the decrease in output was due to the fact only one dredge was operated during the year. Discovery of placer tin has been reported from Potato and Humboldt creeks, the bulletin further states, as well as on Seward peninsula and from Moran creek, where the gravels are said to contain 2½ pounds of tin and 10 cents in gold to the cubic yard.

Coke is a smokeless and clean fuel and offers the best means of making our large cities smokeless. It is known that in large cities where soft coal is burned for domestic heating about 60 per cent of all the smoke in the atmosphere is made in the residential section in house-heating furnaces. Substituting coke for soft coal will eliminate this 60 per cent of smoke. The smoke made in house-heating furnaces is much more objectionable than the smoke made in industrial plants because it is made in the residence section where it does the most harm.

Designs New Pressure and Volume Indicator

Following many years of experience in the manufacture of industrial instruments, the Bacharach Industrial Instrument Co., Pittsburgh, has just developed a pressure and volume indicator for use in connection with the regulation of the blast for cupolas. This instrument consists of a Pitot tube which is inserted in the blast pipe and connected to the pressure and volume indicator as shown in Fig. 2. The connection from the static opening of the Pitot tube has two branches, one leading to the pressure gage, which gives the static pressure of the blast and the other to one side of the volume indicator. The connection from the impact opening of the tube is led to the other side of the volume indicator. This indicator is an inclined tubegage, completely inclosed so as to be dust proof, and is filled with a liquid which will not freeze or evaporate. The scale is graduated to read in cubic feet of air delivered per minute. By means of the linked valves in the connection to the instrument the zero of the indicator can be checked at any time without breaking any of the connections.

The pressure gage is of the single tube type, and is V-shaped so as to be easily read. It is graduated to read in inches of water. The Pitot tube has large openings so that there is little trouble from clogging due to the dust in the blast.

Where exhaust steam from reciprocating engines is used for heating purposes, a coating of oil usually forms on the inside of the return pipes and protects the metal considerably.

Develops New Heavy Duty Stamping Press

A new double crank toggle drawing and deep stamping press, especially designed for the manufacture of automobile bodies, fenders, hoods, radiators, and other stampings, has been developed by the Toledo Machine & Tool Co., Toledo, O. As shown in the accompanying illustration, the press frame is of four-piece steel tie rod construction, consisting of a base, two uprights and a crown held together by four large rods which are shrunk in place. The blank-holder control mechanism is essentially two complete independent units combined in one frame. There are two pairs of rocker shafts operated from each end, and rotating in bearings of ample size to withstand the blank holding pressure. The blank-holder or outer slide and the plunger or inner slide move in long bearings which provide support and alignment.

The press has twin gear drive on the main shaft, all gears and pinions being machine cut from the solid blanks. All gears are protected by heavy metal guards to protect the operator and to comply with safety laws. The press may be driven by an individual electric motor mounted on a special foundation or on the wall or ceiling and belted direct to the flywheel of the press.

DOUBLE CRANK TOGGLE PRESS FOR AUTOMOBILE STAMPINGS

Education is Aid to Safety

BY T. F. JENNINGS

NINETEEN years have passed since Dr. William H. Tolman started the American Museum of Safety in New York, which is thought to have been the first organized move in the United States against preventable deaths and injuries. The battle against accidents has materially reduced the casualty rate. More important, it has caused an analysis of accidents so thorough that all are becoming experts on dangers to be avoided.

The casualty toll bears out the claim of authorities that 80 per cent of accidents are due to carelessness. It is further illustrated by the accident records of dynamite making. There are few accidents in this industry because the workers know they are in the presence of death. They daily demonstrated that personal caution is the most effective prevention of accidents.

Safety investigations by large employers of labor, including the General Electric Co., have revealed that there are certain ages, hours and days when people relax their vigilance. The most careless age is between 22 to 26. More accidents occur on Monday than any other day. More accidents occur between 9 and 10 in the morning than any other hour of the day or night. It is evident that people have a tendency after a period of rest, to return to work in a careless attitude. The relaxation of the body is accompanied by a relaxation of vigilance and caution. The prevention of accidents can never become automatic. Safety devices help materially, but human caution is the most powerful protection against injury.

Franklin K. Lane, secretary of the interior, recently issued a statement which included the following:

"In mines and in a large number of our most important industries, 50 per cent of the people working there are foreign born and they have signs printed for their welfare and to protect them. These signs have to be printed in seven, eight or nine different languages, and many of the people cannot read them in any language. In the mining industry alone it has been estimated that we can save at least 150,000 accidents a year if those people can be taught to read enough English to understand the signs and directions that are placed before them. Now we have got to turn ourselves into a council of progress and frame a national purpose. It means that democracy, in essence, is that every man has a chance. The very thing to be done now is that we shall put into the hands of every man born in this country the tools by which he can open the archives of Americanism. If we can do this we will produce the greatest of all nations and a new race that will long hold a compelling place in the world."

Americans should not view with contempt foreign-born labor, because as Secretary Lane states, 3,000,000 American farmers cannot read English, and one-fourth of drafted men

were unable to understand officers' orders.

Fortunately, the world is now coming to see that if a man does not know what is good for him in a matter of this kind, the question must be decided for him. The welfare of all, certainly must come prior to the folly of the few.

In teaching men and women the importance of being watchful and careful of their safety, it is the method of teaching and the qualifications of the teacher that count in the long run. One cannot learn this language in a week, nor a month, nor by any other spurt of effort. It must come from his heart with love for his fellowmen.

Builds Blast Furnace Plant in India

IRON and steelmaking in the Far East has received a great impetus during the past decade and in Japan and India numerous blast furnaces and steel works recently have been completed or are under construction. One of the latest companies entering the field in India is the Indian Iron & Steel Co., Ltd., Calcutta. This company was formed early in 1918, with Burns & Co. as managing agents, for the purpose of utilizing iron ore and coal properties which had been prospected and acquired. These holdings showed such promise that during the latter part of 1918, it was decided to build the first unit of a complete steel plant at Asansel, India, a town located on the East India railway about 120 miles north of Calcutta. This location was chosen on account of its proximity to the coal fields.

Under the direction of G. H. Fairhurst, preliminary work was completed and contracts were let for the construction of a complete 350-ton blast furnace and a 168-oven by-product coke plant. Simon-Carves, Ltd., Manchester, England, received the contract for the construction of the coke plant and Arthur G. McKee & Co., Cleveland, were retained as engineers and contractors for the construction of the blast furnace plant. The work of designing was started during March, 1919, and shipments of materials were started during April. Approximately 85 per cent of the materials of construction already have been started overseas and the balance probably will be on shipboard before the end of the year.

During September of the present year, the Indian Iron & Steel Co. decided to further increase its capacity and accordingly orders were issued to proceed with the construction of a second blast furnace of similar design to the first.

Plan for Six Furnaces

The layout of the completed plant provides for the ultimate installation of six blast furnaces, each of from 350 to 400 tons capacity, sufficient coke plant capacity to provide fuel for these furnaces, and the addition later on of open-hearth furnaces and rolling mills to finish all the iron produced in the blast furnaces.

The plan of the proposed blast furnace plant is shown in Fig. 1. No. 1 furnace will be 85 feet high, and will have a hearth 14 feet 6 inches in diameter and a bosh 19 feet in diameter. The furnaces are arranged in pairs, each pair having a common cast house. The product of the furnace is to be disposed of in ladles; tinder cars made by Dewhurst's Engineering Co., Sheffield, Eng., being provided for this slag and 75-ton short-pour ladles for the iron.

Owing to the amount of available ore suitable for making ferromanganese, extra large stove capacity is provided, the installation consisting of five hot blast stoves, each 25 feet in diameter and 95 feet high. The stove linings are of the side combustion type laid up with standard 9-inch brick. All brick linings for stoves and furnaces are manufactured in India with the exception of the furnace hearth and bosh brick, which are being supplied from America. In addition to a dustcatcher, two centrifugal-type dust separators are to be installed, provision being made to later install a dry dust cleaning system.

The skip bridge, hoist engine and

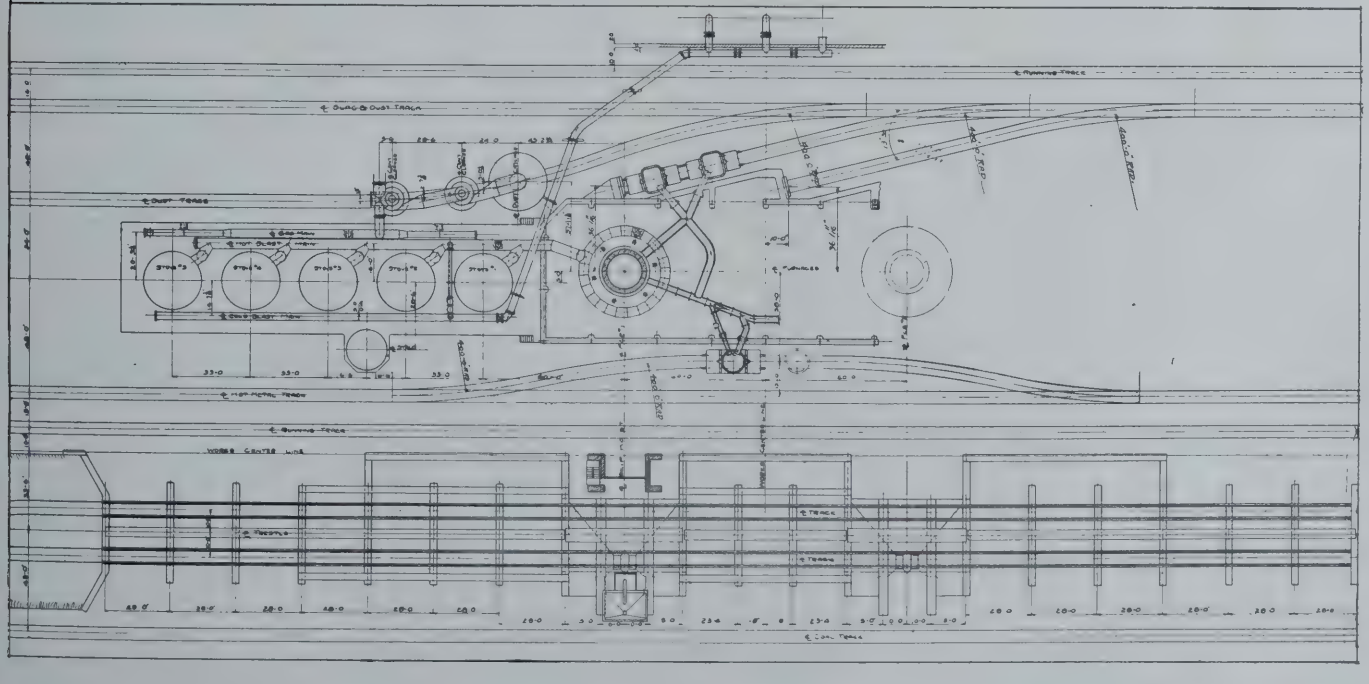

FIG. 1—PLAN OF NEW BLAST FURNACE OF INDIAN IRON & STEEL CO., CALCUTTA. NOTE THE PROVISION MADE FOR FUTURE ADDITIONS

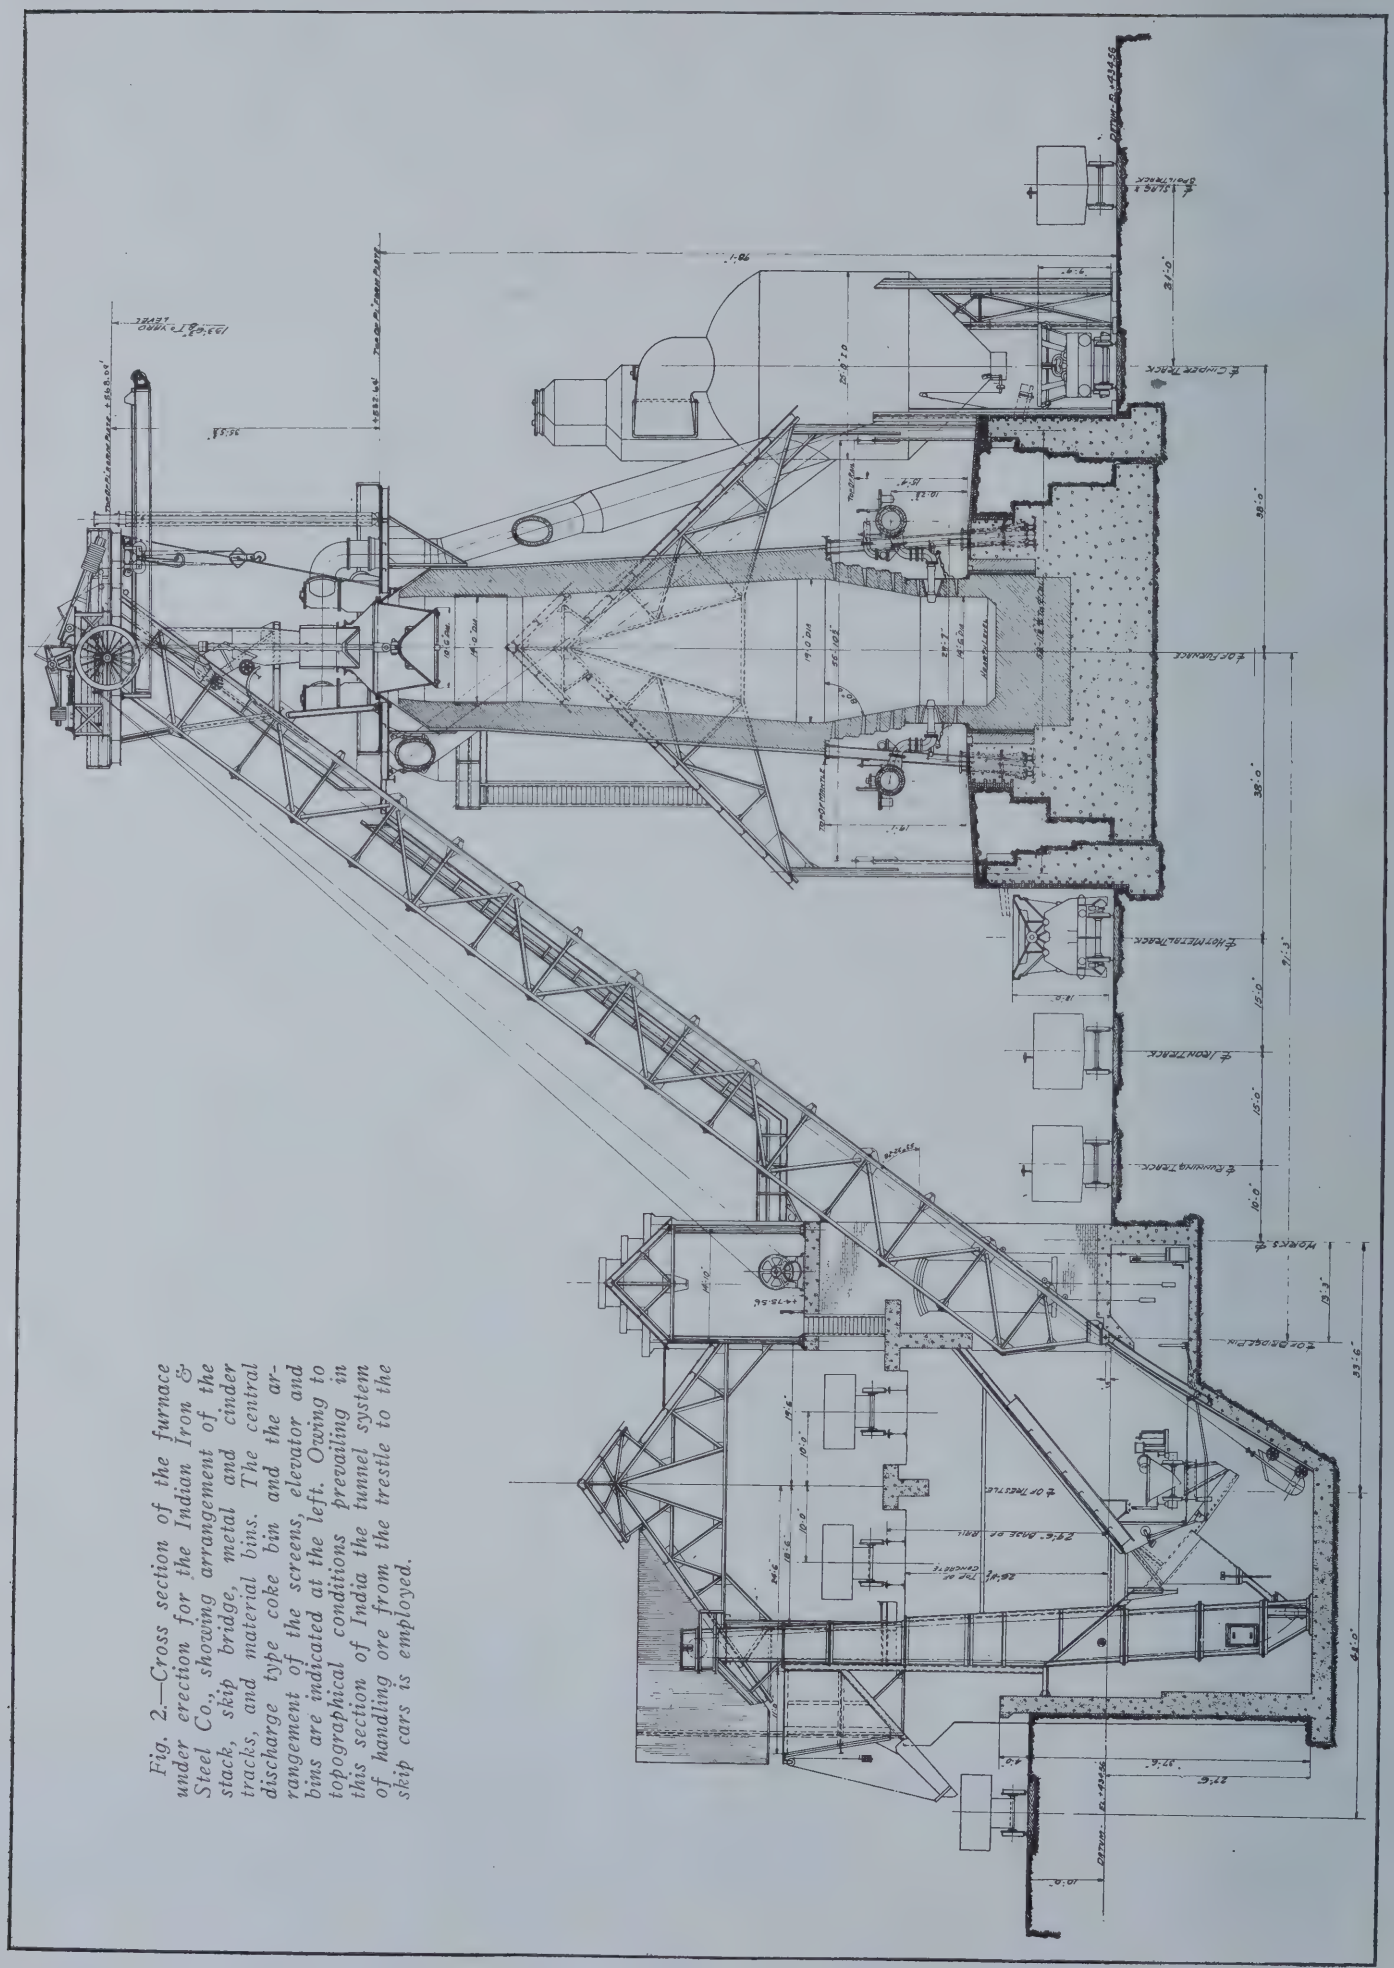

Fig. 2.—Cross section of the furnace under erection for the Indian Iron & Steel Co., showing arrangement of the stack, skip bridge, metal and cinder tracks, and material bins. The central discharge type coke bin and the arrangement of the screens, elevator and bins are indicated at the left. Owing to topographical conditions prevailing in this section of India the tunnel system of handling ore from the trestle to the skip cars is employed.

arrangement of the bell operating mechanism, which are of standard design and construction conforming to modern American practice, are shown in Fig. 2. This drawing also shows a section through the central discharge type coke bin and the arrangement of the coke screens, the coke breeze elevator and bins. A McKee patented revolving stock distributor is provided for distributing the furnace charge.

Due to local topographical conditions the tunnel system for handling the ore from the trestle to the skip cars is employed. The ore and limestone bin and storage system are embodied in a concrete trestle. A tunnel for the scale car runs the entire length of the trestle. The tunnel roof consists of a series of unit bin bottoms, each provided with a series of continuous segmental type gates arranged for hand-operation from the scale car platform. This arrangement provides a continuous line of gates so that practically all the ore and stone held in storage under the trestle is available at the gates for discharge into the scale cars. The entire stock trestle is double tracked, and on account of the heavy rains at certain seasons it is covered with a steel roof structure.

The blast for the furnaces will be supplied by two Parsons-type blowers, each having a capacity of 45,000 cubic feet per minute. The boiler installation consists of 3500-horsepower units, and are to be operated at 200 pounds pressure with 100 degrees superheat. The boilers and blowers are being shipped from England.

For handling the hot metal, two double-strand pig casting machines, equipped with ladle tilting rigs, are to be installed. Work on the foundations is progressing and it is expected that the first furnace will be in operation in the latter part of 1920.

Production Increased

As soon as a sufficient and steady supply of coke is assured, the blast furnace of the Wheeling Steel & Iron Co., at Martins Ferry, O., will be blown in. Everything is in readiness for the lighting of this stack. The last six mills of the tin plate plant of the company at Yorkville, O., has resumed operations. Although this plant was kept in operation for a time after the calling of the steel plant strike as a result of the fact that it was being operated under an agreement with the Amalgamated Association of Iron, Steel and Tin Workers, a strike of the laborers and mechanics resulted in a complete shutdown. With these six mills on, the plant will be at full capacity for the first time in several weeks.

Increased Orders

For Refractories Make Deliveries Difficult—Operations on Increase

Pittsburgh, Dec. 23.—Both orders and specifications for refractories have expanded appreciably in the past week or 10 days and from a condition where manufacturers found it extremely hard to obtain shipping instructions against old orders, most of them now find difficulty in making shipments as fast as they are desired. During the period while the steel strike was a factor in plant operations, neither the steel plant nor blast furnaces had sufficient common labor to handle shipments and consequently held up deliveries. Because of this condition and the embargoes in force against the steel and iron plants, the brick manufacturers were obliged to stock large quantities and conveying the bricks from the sheds is said to involve more labor and to be a much slower process than running them direct from the kilns to the cars.

With the steel plant more or less of a memory and the coal miners' strike settled, iron and steel works are gradually getting back to a normal rate of operation and most of them badly are in need of refractories and are pressing for deliveries. New orders are coming along quite freely, among them being one for 500,000 fire clay brick from an eastern steel company. Although manufacturers' stocks mounted during the period of inactivity, plant operations, which got down to as low as 30 per cent of capacity in some sections of the country, have increased as a result of the larger demands now in evidence. No change is noted in prices, although the market sentimentally is firmer as a result of the better movement.

One Kentucky manufacturer has advanced his prices $1.50 per thousand, effective Dec. 1. It is reported also that some producers in Missouri have been raising their schedule. Operations in the Kentucky district are put at about 80 per cent at the present time.

Refractories

(Per 1000 f.o.b. works)

FIRE CLAY BRICK
(First Quality)

Pennsylvania	$36.00 to 41.00
Ohio	36.00 to 38.00
Kentucky	36.00 to 41.00
Illinois-Missouri	30.00 to 40.00

FIRE CLAY BRICK
(Second Quality)

Pennsylvania	$30.00 to 35.00
Ohio	20.00 to 25.00
Illinois-Missouri	25.00 to 30.00

SILICA BRICK

Pennsylvania	$40.50 to 45.00
Chicago	45.50 to 50.50
Birmingham	46.50 to 51.50

MAGNESITE BRICK
(Pet Net Ton)

9 x 4½ x 2½	$80.00 to 85.00

CHROME BRICK
(Pet Net Ton)

9 x 4½ x 2½	$80.00 to 90.00

BAUXITE BRICK
(Pet Net Ton)

55 per cent	$ 40.00 base
76 per cent	100.00 base

Canada Needs Steel

Shortage of Sheets and Tin Plate May Close Some Plants

Toronto, Ont. Dec. 20.—Conditions as regards the supply of steel are becoming increasingly serious. Importing companies are attempting to provide for the most urgent needs of consumers. Deliveries of black and galvanized sheets have been fair, but only a small proportion of orders for tin plate and steel sheets can be filled, and a number of manufacturers dependent on importation probably will have to close down or curtail production about Jan. 1. Deliveries on new business are likely to be delayed for several months.

D. H. McDougal, president of the Nova Scotia Steel & Coal Co., who with Vice President W. D. Ross, and Col. Thomas Conley has returned from Europe, states that the prospects of export trade, especially in heavy forgings, axles and other finished products, are encouraging. Shipments of iron ore from the company's Wabana mines are delayed by high freight rates and scarcity of ocean tonnage.

The officials completed the purchase of the Belgian interests in the Arcadia Coal Co., giving the Nova Scotia company control of extensive and valuable coal fields in Pictou county.

Tin smelting from the ore, a new industry for Canada, is being undertaken by the Electro-Tin Products Co., of Brantford, Ont., which has installed a plant with a capacity of two tons of metal per day. Bolivian ore will be used and probably will be transshipped from New York. There is a large market for tin in Canada which will be considerably increased by the requirements of the Baldwin Corp. of Toronto, for the manufacture of tin plate.

Coke Prices Await Coal Award

Control is Not to be Relinquished Until After Commission Adjusts Coal Prices, According to Railroad Administration's Understanding of the Situation—Inquiry Brings Out Some Hidden Phases of Preliminary Coal Settlement

WASHINGTON, Dec. 23.—Coke prices likely will remain in effect until after coal prices have been adjusted by the new commission appointed by the President. This is the opinion of an official of the railroad administration. Just now there is no authority other than the President for the removal of any fixed prices, as the powers of the fuel administrator being exercised by Director General Hines do not include those of price adjustments. Fuel Administrator Garfield gave the director general practically all of his powers, but not price fixing, soon after the fuel administrator's office was revived. Apparently there will be no successor to Dr. Garfield until the new commission determines whether it or some other functionary should be clothed with the powers of the Lever act.

Developments further indicating a surrender by the government to the miners in the recent settlement of the coal strike were made last Friday when Attorney General Palmer and others appeared before the senate subcommittee on interstate commerce. The attorney general's statements before that body are viewed as considerably weakening the government's case and indicates that Mr. Palmer, at first so strong for full compliance with the law, was in the front ranks of those capitulating to labor.

Mr. Palmer's admissions before the committee were strengthened by statements made there by Alfred M. Ogle, chairman of the executive committee of the Bituminous Coal Operators' association. Mr. Ogle declared the attorney general himself had tried to win the operators to a compromise which would have given the miners a higher wage increase than that allowed by H. A. Garfield, formerly fuel administrator, who resigned because of the manner in which the strike was settled. Mr. Ogle also said the President's plan of settling the strike was never submitted to the operators nor had it been accepted by them.

Mr. Palmer said the only difference he could see between the actual settlement basis and that proposed by Dr. Garfield was that the President's plan calls for a "tribunal" and the fuel administrators called for a "consulative body." It is a fact, however, that the President's tribunal will supplant the fuel administration and will have all the powers of the Lever act under which to operate. Dr. Garfield's committee would have acted only in an advisory capacity.

The real difference between the two is that the President's plan, as proffered the miners by Mr. Palmer, admittedly provides for the readjustment of both wages and prices, whereas the Garfield plan contemplated only an adjustment of wages. According to Mr. Ogle, however, up to the time of the settlement of the strike it was not a matter of wages and prices, but one of principle whether law and order should be upheld. According to Mr. Palmer, "there was no settlement of the strike, but an arrangement which finally accomplished the object we wanted, the production of coal."

It would appear from Mr. Ogle's remarks that Mr. Palmer held Judge Anderson of the Indianapolis court more or less in contempt. The operator told the committee Mr. Palmer informed the operators' committee when he attempted to win them to a compromise that "Judge Anderson would act in a characterisctic fashion and put some of these men (the miners) in jail for violating his injunction under the Lever act. There might be a general uprising which ought to be avoided." According to Mr. Ogle, the attorney general said regarding Dr. Garfield that he "was only a temporary official and that his proposal of a 14 per cent increase could be set aside."

Coal mining operations last week were so improved as a result of the strike settlement that government officials, some of whom were greatly displeased with the means by which the settlement was achieved, are gratified over the output. The car supply, dislocated by five weeks of inactivity at the mines, is rapidly being adjusted to demands and at the office of the railroad administration the belief was expressed that Monday will perhaps see a record day's output. Dec. 12 saw a production of only 1,058,000 tons, or 52.5 per cent of the prestrike average. Four days later this percentage had increased to nearly 80. the number of tons being 1,595,000.

What this means may be estimated from these figures prepared by the administration. The average daily production in the corresponding week in December, 1917, was 30,000 cars. In the comparative period this year the daily average was 30,392, more than in the same week in 1916 and also in 1918. No more coal is being held in storage on wheels than territorial needs make advisable, Director General Hines said today, and every possible effort is being made with a view to the expeditious handling of empty cars. Practically the only coal restrictions now in effect, except as to prices, is that forbidding export.

The coal cars loaded on Dec. 17 were 110.9 per cent of the daily average loaded in the week ending Dec. 20, 1917. On that day the number of cars was 32,989; in 1918, 29,973; in 1917, 29,752, and in 1916, 29,049. The record loading on Dec. 17 this year was in the Pocahontas region where the loading was 161.3 per cent of 1917. In the Allegheny region it was 117.9 per cent. The eastern and northwestern regions were the only ones in which the Dec. 17 output was lower than in 1917.

Shipping Board Sells Its Surplus Steel

WASHINGTON, Dec. 23.—Disposing of all of its surplus steel, approximately 300,000 tons, consisting almost entirely of plates, shapes and bars, the United States shipping board, Emergency Fleet corporation, at an auction held here last Thursday sold the entire tonnage to L. B. Bardie, of M. Bardie & Sons, Portland, Oreg. Practically half of the tonnage is fabricated. The price paid for the fabricated material, $25 a ton, and for the unfabricated steel was $45 a ton, f.o.b. cars place of location. The price of 2.25c per pound for unfabricated steel compares with prices of 3.25c, 3.00c and 2.90c, Pittsburgh, paid by the Fleet corporation for plates, shapes and bars, respectively, during the war, as against present market

levels of 2.65 to 2.75, 2.45 to 2.60, and 2.35 to 3.00c, Pittsburgh, on plates, shapes and bars, respectively.

The auction, in charge of Chairman John Barton Payne, of the shipping board, was held in accordance with the policy announced some time ago to sell publicly all of the surplus steel and equipment, supplies, etc., which accumulated as the result of the cancellation of shipbuilding contracts and the taking over of material following the adjustment of claims.

The auction was attended by a large number of prospective buyers, principally dealers and jobbers, although some of the large mills were represented but did not show much interest as bidders, partly because they did not know the exact specifications of the steel and its condition. The successful bidder in this large transaction, involving about $10,500,000, did not make known what disposition he proposed to make of the steel. The general opinion is that much of the tonnage can be sold to private shipbuilders, while some may be sold to other dealers or disposed of for remelting. The steel is said to be in good shape for the most part and is located, except in one or two unimportant instances, north of North Carolina and east of the Rocky mountains. The first bids were made at $20 for the fabricated material and $40 for the unfabricated tonnage. The former tonnage consists largely of odd lots, while it is said that plates, shapes and bars, as well as a comparatively small tonnge of sheets, will require considerable work of classification. Of the unfabricated material, practically 70 per cent consists of plates, 20 per cent of shapes and 5 per cent of steel bars.

The next auction, the date of which has not been determined, will involve the disposal of machine tools, dock machinery and equipment, electrical equipment, pipe valves and fittings, boiler fittings and accessories, etc., and will be followed by others until the entire surplus property of the corporation is sold.

Among those who attended the auction were:

Carl R. Briggs, John H. Turvis and L. Greenberg, represented by former Senator J. Hamilton Lewis, as counsel; Ernest L. Dugas, Philadelphia; L. B. Bardie, Portland, Oreg.; J. Russell Hundley, Portland, Oreg.; H. F. Knapp, Carnegie Steel Co.; Frank and A. Harris, Harris Bros., Chicago, represented by Attorney A. L. Thurman; Charles Shongood, New York; H. A. Hitner Sons & Co., Philadelphia, represented by Coleman E. and Joseph G. Hitner; Charles G. A. Pfitson, national bureau of supplies; Thomas Friedeberg, New York, represented by J. J. Cassaday, New York, and W. B. Eichleay, Pittsburgh; R. D. Young, Pittsburgh, represented by Leo Oppenheimer and Stuart G. Gibboney, New York.

Urges Aid for Producers of "War Minerals"

Washington, Dec. 23.—Encouragement by the government of the mining of essential war minerals, preservation of skeleton munition plants, and the creation of a skeleton organization, such as the former war industries board, with the proposal that the organization be centered in the department of commerce, are recommended by Bernard M. Baruch, former chairman of the war industries board, in a report to the President reviewing the activities of the board. The report has been submitted to congress by the President.

"Every possible effort should be made," the report states, "to develop production of manganese, chrome, tungsten, dyestuffs, by-products of coal and all such raw materials usually imported, but which can be produced in this country. Above all immediate and persistent effort must be made to develop production of nitrogen and its substitutes, not alone for war but for agricultural purposes."

Dealing with the work of the board, Mr. Baruch said that "not one default was recorded on any demand" made on it by the military establishment, and that "there was not a slacker to be found among the industries."

France to Select Tools Under Big Contract

Washington, Dec. 23. Details of the contract made by the war department last week with the French government for the sale of $25,000,000 worth of machine tools from the surplus stocks held by the department in the United States now are available. Payment for these tools is to be made in French government bonds, bearing 5 per cent interest, payable in gold in 10 years in the United States. The French government is to make its own selection of tools within one year, subject to prior sale. The tools are to be paid for at prices fixed by the service chart adopted by the war department, Aug. 9.

A special commission has been appointed by the French government to visit the United States shortly to select such tools as may be desired. Sales are to be at point of location of the tools selected and with the tools in the condition in which they exist. The mission will, during the period given for selection, be given complete inventories of all surplus machine tools held by the war department from which selection may be made.

Upon selection and notification to the director of sales, title to any tool so selected passes to the purchaser and delivery is to be deemed as having been made. The tool then remains at the risk of the purchaser and if not removed within 30 days the war department may cause the machine to be removed to storage at the expense of the purchaser. Statements of machine tools purchased will be furnished by the war department every six months and within 60 days payment in French bonds is to be made to the treasurer of the United States. The French government is required to accept only those tools which are suitably priced for its purpose. Resales in the United States are not permitted without the expressed consent of the sales director.

The contract was signed for France by S. Pinchon, minister of foreign affairs; E. L. Klotz, minister of finance, and L. Loucheur, minister of industrial reconstruction. The special mission is to be composed of Monsieur Hedde, as chief, and Messieurs Gouge, Dronzy, Obry, Tribbot, Duteurtre, Maurice, Marchapt, Albat and Hubert.

Two Bids on 13,300 Tons of Ship Plates, Shapes

Washington, Dec. 23.—Only two steel manufacturers submitted bids on the first 13,300 tons of plates and shapes required in the construction of two battle cruisers, to be built at the Philadelphia navy yard. Bids were opened by the bureau of supplies and accounts, navy department, Dec. 19. The Carnegie Steel Co. quoted 2.50c on 10,000 tons of plates and 2.40c on 3300 tons of shapes. The Midvale Steel & Ordnance Co. quoted only on plates.

Joins Trade Board

Washington, Dec. 23.—Confirmation by the senate last week of the President's nomination of Nelson B. Gaskill of New Jersey to succeed J. Franklin Fort, as a member of the federal trade commission increases the personnel of the commission to four but still leaves another vacancy. The successor to William J. Harris, now United States senator from Georgia, has not been named. Besides Mr. Gaskill the personnel of the commission includes Victor Murdock, chairman, Huston Thompson, vice chairman, and William B. Colver.

Men of the Iron Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

JAMES H. GROSE, as intimated in the Dec. 18 issue of THE IRON TRADE REVIEW, will be the future president of the Brier Hill Steel Co., Youngstown, O., to succeed William A. Thomas, as is now formally announced. At present he is general superintendent in the Youngstown district for the Carnegie Steel Co. He will be elected on or about Jan. 1, according to a recent announcement of the Brier Hill company's board of directors, when he will leave the Carnegie organization.

John A. Scott, Indiana, Pa., has been made general solicitor of the Rochester & Pittsburgh Coal & Iron Co.

C. E. Beeson, secretary of the Pittsburgh Steel Co., recently was elected a director of the Duquesne National bank, Pittsburgh. Mr. Beeson succeeds the late Wallace H. Rowe.

C. H. Hoefer has been appointed foundry superintendent for the Fluid Compressed Steel Co., Keokuk, Iowa, having had previous steel foundry experience in Dayton, O., and elsewhere.

C. E. Cullum recently resigned as supervisor of foundry practice for the General Motors Truck Co., and has been made production superintendent for the Industrial Foundry Co., St. Johns, Mich.

W. R. Phibbs, assistant general manager of the Steel & Tube Co. of America, Mayville, Wis., resigned recently to become eastern representative of the James A. Brady Foundry Co., Chicago, manufacturr of forced draft convertible stokers.

Charles Unverferth has resigned after 21 years of service with the Platt Iron Works, Dayton, O., to form a new business connection at that city. During that period, Mr. Unverferth rose from the position of stenographer to that of secretary of the company.

J. L. T. Waltz has been elected president of the Bremer-Waltz Corp., 30 Church street, New York, importers and dealers in aluminum and other metals; C. P. Verkruzen, vice president and assistant treasurer; P. B. Adrian, secretary.

William L. Moorhead has resigned as vice president of the Duquesne Electric & Mfg. Co. to join Henry T. Parsons in forming the Parsons-Moorhead Machinery Co., doing a general machinery business, with offices at 237 Fourth avenue, Pittsburgh.

F. B. Herendeen, who has been Pittsburgh district manager of sales for the Witherow Steel Co., Pittsburgh, has been appointed Michigan district sales manager of the company, with headquarters at Detroit and shortly will leave to assume his new position.

Harry Peck, for the past eight years head of the machinery department of the United States Shoe Machinery Co. in Marlboro, Mass., has accepted a position as superintendent of the Mossberg Pressed Steel Corp., Attleboro, Mass. Mr. Peck served as captain in the war.

E. D. Clarage, who has been manager of the Cleveland branch of the Columbia Tool Steel Co., Chicago Heights, Ill., has resigned, effective Jan. 1, 1920. Mr. Clarage expects to spend a month or two in California, after which he will return to Cleveland to enter business for himself.

C. E. Lesher, statistician of the geological survey, in charge of weekly coal and coke production figures, has resigned to associate himself with the National Coal association, with headquarters at Washington. F. G. Tryon is acting for the bureau in the place of Mr. Lesher.

William S. Kies has resigned as a vice president of the American International Corp. to become a general partner in the firm of Aldred & Co., New York, effective Jan. 1. Mr. Kies formerly was vice president of the National City bank. He has been associated with the American International Corp. since its organization.

H. G. Bain, who until recently was attached to the San Francisco sales office of the Midvale Steel & Ordnance Co., now is a member of the sales organization of the Tacony Steel Co., Tacony, Philadelphia, and will represent that company in the upper part of New York state. Mr. Bain, in addition to a long sales experience, has had considerable practical experience in the mills. He is thoroughly conversant with the tool steel, alloy steel and forging branches of the steel business.

D. F. Collins has been appointed eastern representative of the Hill Clutch Co., Cleveland, in charge of its New York office, 50 Church street. Mr. Collins has been connected with the company's general sales department at Cleveland since discharged from military service last summer.

A. H. Fosdick, superintendent of the employment and welfare department of the Bethlehem Steel Co., Bethlehem, Pa., has been appointed assistant to George M. Hohl, superintendent of blast furnaces at Bethlehem. George W. Vary has been appointed superintendent of the employment and welfare department, succeeding Mr. Fosdick.

Myron T. H. Blanchard, lately with the Hydraulic Pressed Steel Co., Cleveland, has been added to the Cleveland sales force of the Tacony Steel Co., Tacony, Philadelphia. Mr. Blanchard has had considerable metallurgical experience, having been connected with the metallurgical departments of the Bethlehem Steel Co., and the Canton Spring & Axle Co.

T. S. Hanna is manager of the office recently established at 30 Church street, New York City, by the Vulcan Crucible Steel Co., Aliquippa, Pa., maker of tool and alloy steels. Mr. Hanna is well known in the tool steel trade, having represented the Howe-Brown Co., and later the Colonial Steel Co., in the New York district, and also William Jessop & Sons, in Boston.

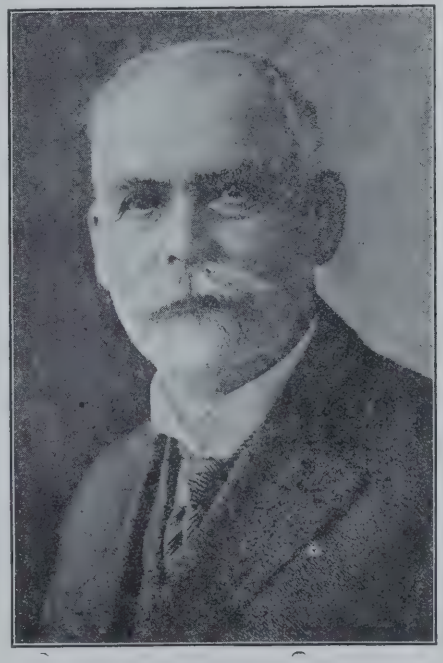
Matthew J. Scammell, formerly assistant general manager of the Sparrows Point, Md. plant of the Bethlehm Steel Co., now is general manager of the Dunbar, Pa., furnaces of the American Manganese Mfg. Co., Bullitt building, Philadelphia. He succeeds L. S. Kerchner, who has been transferred to Pittsburgh, having been placed in charge of the company's office recently established at 940 to 944 Oliver building, that city.

Men of the Machinery Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

FRANK O. WELLS has resigned as president and director of the Greenfield Tap & Die Corp., Greenfield, Mass., and is succeeded as president by Frederick H. Payne, formerly vice president, to whom he has sold his entire holdings. F. G. Echols, vice president and general manager of the company, has been elected a director to fill the vacancy caused by the retirement of Mr. Wells, who will remain with the corporation in an advisory capacity. Mr. Wells is one of the most prominent figures in the screw thread industry in the United States and has given much time and study to its standardization. A few months ago he went abroad to London, Paris, etc., and attended the world congress on the standardization of screw threads.

He was born in Shelburne Falls, Mass., Jan. 6, 1855, and was educated in the common schools and at Petersham academy. At 18 he started work at a daily wage of $1 and three years later he and his brother organized the Wells Bros. Co., with a capital of $1100. Later this organization was merged with the Wiley & Russell Mfg. Co., forming the Greenfield Tap & Die Corp., capitalized at $3,000,000, of which Mr. Wells became and remained president until his recent retirement.



Among his fellow members of the American Society of Mechanical Engineers, Mr. Wells is known as "Wells, the screw-thread man." At Washington he is known as "Wells, the gage man." This latter designation came about because of his war activity, which was fully covered in an article in the April 26, 1917, issue of THE IRON TRADE REVIEW, wherein was told how he studied the problem of making gages for American industry on a wartime basis.

In addition to his activity with the Greenfield corporation, Mr. Wells is interested in various business enterprises. He is director of the Greenfield Machine Co., and of the Lincoln Twist Drill Co.

. Daniel P. Harrower has been promoted to employment manager of the Graton & Knight Mfg. Co., Worcester, Mass., succeeding Theodore C. Greene, resigned, who has gone to the Winchester Repeating Arms Co., New Haven, Conn.

Ernest E. Opitz, for the past two years traffic manager of the Worcester, Mass., chamber of commerce, has resigned to join the traffic department of the Norton Co. in that city, Jan. 2.

D. O. Dugger has been placed in charge of the branch office recently established in the Kansas City Life building, Kansas City, Mo., by Joseph E. Nelson & Sons, Chicago.

FRANK O. WELLS

J. W. Harris has been made Ohio representative for the Austin Western Road Machinery Co., Chicago. He will take charge of the branch plant to be erected soon on property recently acquired in Columbus, O.

William Aitchison, M. R. Rawson and Charles W. Rawson have been elected directors of the Washington Machinery & Supply Co., Spokane, Wash. Harry Rawson has been appointed shop superintendent.

J. C. Mackrell Jr., on Jan. 1 will assume his new duties as sales manager of the Electric Welding Co., Pittsburgh. Mr. Mackrell for several years has been with the Witherow Steel Co., Pittsburgh, having been district manager of sales for the company in Ohio and West Virginia.

Emlen S. Hare, president of the Mercer Motor Co., is to be president of the new Locomobile Co., Bridgeport, Conn., it is announced. O. E. Hunt, H. S. Church, Henry Lansdale and C. L. Guyman, until recently connected with the Packard Motor Car Co., Detroit, are also to become associated with the new Locomobile Co.

C. T. Abbott has been elected secretary of the Winther Motor Truck Co., Kenosha, Wis., and George D. Smith was elected vice president and director. Mr. Smith recently reorganized the company's sales, advertising and service departments. Charles H. Meeker has been placed in charge of the company's new export department and H. D. Snyder has been made assistant general sales manager.

J. D. Smith, formerly works manager of the Timken-Detroit Axle Co., Detroit, has been added to the executive staff of the Torbensen Axle Co., Cleveland, as manufacturing manager; G. W. Veale, formerly production supervisor, and C. W. Carlson, formerly engineer of the Timken plant, have been appointed production superintendent and engineer respectively of the Torbensen company.

E. A. Wilson of the Ingersoll Machine Co., Ltd., Ingersoll, Ont., has been appointed vice president and joint manager with J. A. Coulter of the John Morrow Screw & Nut Co., that city. The Morrow Co. has purchased an interest in the Ingersoll Machine Co., Ltd., and the American Machine Products Co., Inc., Detroit, and will operate them together with the Ingersoll File Co. as subsidiaries.

A. H. Gifford has been placed in charge of the branch office recently established at 521 Chamber of Commerce building, Rochester, N. Y., by the Leland-Gifford Co., Worcester, Mass., maker of sensitive drilling and profiling machines. O. H. Leidy has been added to the company's Chicago sales force, whose headquarters now are located at 621 West Washington boulevard.

Obituaries

WILLIAM H. HART, who died at his home in New Britain, Conn., on Dec. 13, was for many years president of the Stanley Works, New Britain, Conn., with which he was actively identified for more than 65 years. He was one of the best known captains of industry in Connecticut and was called the dean of New Britain manufacturers. He was 85 years old. On May 17, 1914, Mr. Hart relinquished the presidency of the Stanley works and was elected chairman of the board of directors which position he resigned Jan. 10, 1918. He continued on the board of directors up to the time of his death. He largely was instrumental in the development of the business. Due to his work in the early days of the Stanley works its organization was put on a substantial basis and today it occupies a place as one of New Britain's great industries. The little enterprise employing 25 or 30 operatives and having a capital of $30,000 today is giving employment in its several plants to about 4000 people and its capitalization is $2,500,000.

At the age of 19, on May 16, 1854, Mr. Hart became secretary and treasurer of the company, which had been incorporated in 1852. For many years the company had a hard struggle against competition but finally purchased four of the principal companies in the field. Other plants were acquired by the Stanley Works. This company is said to be first to drive pins as well as rivets by machinery; the first to cold-roll iron or steel, and it made wrought butts out of steel six years before others inaugurated that practice. It was Mr. Hart who made the first telescope box for the products of the works and he considered the invention worth $500,000 to the company. Under Mr. Hart's direction the Stanley works also was first in the United States to reduce iron hoops and bands to a uniform thickness and to produce a fine surface by passing the cold metal between highly polished rolls. He also was responsible for placing the company's cold rolling mill in operation in 1873, in addition to its hot rolling mill at Bridewater, Mass.

Stephen P. Brown, civil engineer, who recently resigned as vice president of Ford, Bacon & Davis, New York, was drowned, Dec. 6 at Sebec Lake, Dover, Me. Mr. Brown aided in the construction of the Pennsylvania terminal, New York, and had charge of the work of constructing the Canadian Northern railroad terminal in Montreal.

James Lounsbury Mead, for more than 30 years connected with R. B. & W. Bolt & Nut Co., Greenwich, Conn., died at his home in that city, Dec. 14, aged 59.

Charles Keith Blackwood, president of the Sullivan Machinery Co., Chicago, died Dec. 13, at his home in Kenilworth, Ill., a suburb of Chicago. Burial was in Detroit.

Clarence Stilson, an official of the Scoville Mfg. Co., Waterbury, Conn., died at his summer home, Wildemere, Short Beach, Branford, Conn., Dec. 18.

Benjamin Y. Jeffries, 68, superintendent of the New Castle, Pa. plant of the Stove & Range Co., Pittsburgh, died at his home in New Castle, Dec. 16, of pneumonia.

Frederick A. Brainard, vice president and secretary of the Ingersoll-Rand Co., New York, died recently, at his home in Mt. Vernon, N. Y., aged 58. He was a director in several associated companies.

George A. Weber, son of Henry George Weber, pioneer wagon manufacturer, died Dec. 8, in Chicago. The Weber Wagon Works was founded in 1846 and in 1890 was absorbed by the International Harvester Co., by which it is still operated.

Joseph B. Dickson, aged 58, coal dealer of New York City, formerly chairman of the anthracite committee of the United States fuel administration, died in a hospital in New York, Dec. 12, following an operation. He was buried at Morristown, N. J.

William H. H. Wooster, president of the Seymour Mfg. Co., Seymour, Conn., brass and german silver, and vice president of the H. A. Mathews Mfg. Co., Seymour, bicycle and automobile parts, who was one of the best known manufacturers in Connecticut, died in a New Haven, Conn., hospital, Dec. 17, aged 79 years. He was one of the incorporators of the Seymour Mfg. Co., and its first secretary and treasurer.

Eugene L. Cushman, chairman of the board of directors of the Cushman Chuck Co., Hartford, Conn., which was founded by his father, the late Austin F. Cushman, died at his home in West Hartford, Dec. 17, aged 65 years. He had been sick 18 months following an attack of influenza.

George R. Collingworth, an inventor of special machinery and vice president of the Garvin Machine Co., New York, died on Dec. 15 at his apartments in the Hotel Colonial, that city, aged 82. Mr. Collingworth invented the ticket chopping machine used on the elevated railroads in New York city.

Louis J. Mueller, president of the L. J. Mueller Furnace Co., Milwaukee, and prominent in business circles of that city, died suddenly on Dec. 16, aged 82. Mr. Mueller was born in New York City in 1837, where he obtained his early education. He also learned the tinner's trade in New York and removed to Milwaukee in 1855. Shortly after, he engaged in the hardware business, which later was expanded when the manufacture of furnaces was taken up.

Lyman W. Ellingwood, formerly general manager and secrtary-treasurer of the John Deere Plow Co., Indianapolis, died Dec. 14, aged 45. He retired from business in 1914 on account of ill health. He served as a director of the Syracuse Chilled Plow Co., and was on the board of directors of the Deere company of Syracuse, Baltimore and Atlanta at various times. He was one of the original tentative directors of the consolidated Deere & Co.

William R. Wilson, who as a member of the firm of Wilson & Bates, Philadelphia, jobbers in iron, steel and blacksmith supplies, was engaged in business for 36 years, died Dec. 8, after a 7-weeks illness. When Mr. Wilson's firm retired from business Jan. 1, 1919, he resigned the presidency of the National Iron, Steel and Heavy Hardware association, a position held by him for over six years. He was born in Philadelphia, educated in its public schools and finally was graduated from the Philadelphia college of pharmacy. After following the drug business for several years, he formed the partnership to engage in the jobbing of iron and steel supplies.

New Chain Plant Begins Operations at Yards

A 40-acre cornfield gave way to provide a place for the new electric welding plant of the United States Chain & Forging Co., at York, Pa., operations in which recently started. This plant, which is the largest single chain plant in the world, is housed in a fireproof building of steel, concrete and brick construction, 1½ stories high, with monitor type of roof, 150 feet wide and 800 feet long and contains about three acres of floor space.

Something of a record was established in the time of construction. The company took possession of the land on July 29, cleared it in two days and began the work of erection on Aug. 1. The work was completed exactly three months later. The Fort Bridge Steel Co., which had the contract for the steel for the building, amounting to 27 carloads, erected the material in 12 days. This was accomplished by the laying of a temporary track through the middle of the plant site and the use of an 80-foot boom locomotive crane, the steel being lifted directly from the cars.

At this plant, located on the main line of the Pennsylvania railroad to Baltimore and Washington the company manufactures trace chain, coil chain and up to and including ½-inch machine chain for antiskid devices, chandelier chain and all other classes of welded chain running ½-inch and smaller. It is being operated in conjunction with the other plants of the company located at Columbus and Marietta, O.; Huntington, W. Va. and McKees Rocks, Pa.

The plant is operated entirely by electric power, which at the present is being purchased from a commercial company. Heat for the building is provided from a plant located at one end of the structure. Equipment is all of the company's own designs.

To Build New Stack

The Thomas Iron Co. is dismantling its No. 3 furnace at Hokendauqua, Pa., and will erect in its place a strictly modern blast furnace of about 400 tons daily capacity. It will be provided with a McKee type revolving top with double skip arrangement for charging raw materials. The new furnace is expected to be available by June 1. In connection with the furnaces at Hokendauqua, there is being installed a pig casting machine, and a new boiler plant with water purification system and new steam lines. No. 3 furnace, which now is being dismantled, was built in 1863, rebuilt in 1899 and remodeled in 1914.

Adopt New Schedule on Tacks and Nails

A new schedule of net differentials of tacks and nails for the wholesale hardware trade recently was adopted by the American Tack Manufacturers association and became effective Nov. 19. These differentials are to be added to the base price. The list conforms with the laws governing weights and measures under which all packages must contain full net weight. The table of differentials is as follows:

TACKS

Size of Tack—Number	12 & larger	10	8	6	4	3	2½	2	1½	1
Bill Posters' Tacks										
Bulk 100-lb. Kegs	4.10	4.20	4.30	4.40	4.50	4.75	5.25	6.00		
American Carpet Tacks										
Bulk 100-lb. Kegs	4.50	4.85	5.25	5.50	6.00	7.25				
Upholsterers' Tacks										
Bulk 100-lb. Kegs	4.90	5.55	6.50	7.00	7.50	8.50	10.05	12.30	15.10	20.20
American Cut Tacks										
Bulk 100-lb. Kegs	5.00	5.70	6.65	7.50	8.00	10.30	12.50	17.30	24.10	29.10
Gimp Tacks										
Bulk 100-lb. Kegs	4.90	5.55	6.50	7.00	7.80	8.80	12.65	14.15	16.75	23.40
Lace Tacks										
Bulk 100-lb. Kegs	5.35	5.85	7.25	8.50	11.40	14.00	15.30	18.25	23.30	29.40
Swedes Cut and Trimmer Tacks										
Bulk 100-lb. Kegs	5.25	5.90	6.85	7.70	8.20	10.50	12.65	17.60	24.50	29.65
Basket Tacks										
Bulk 100-lb. Kegs	5.45	6.60	7.55	9.90	10.30	14.00	19.50	23.20	28.70	30.90
Trunk Tacks										
Bulk 100-lb. Kegs	4.90	5.55	6.50	7.00	7.50	8.50				
Solid Head Lining Tacks Japd. or Silvered										
Bulk 100-lb. Kegs	6.00	6.40	6.75	6.95	7.75	9.25	10.75			

NAILS

Size of Nail—Length	1½ & longer	1¼	1⅛	1	⅞	¾	⅝	½	⅜"
Clout Nails									
Bulk 100-lb. Kegs	4.75	4.90	5.00	5.25	5.40	5.60	5.75	6.40	9.80
Trunk Nails									
Bulk 100-lb. Kegs	4.85	5.00	5.25	5.50	5.65	5.85	6.10	6.50	....
Basket Nails and Chair Nails									
Bulk 100-lb. Kegs	5.00	5.50	6.00	6.25	6.50	6.75	7.00	7.50	8.00

The above list prices apply on regular finishes, blued, bright or black, except Solid Head Lining Tacks, which are japanned or silvered.

The above prices are for packing in Bulk 100-pound kegs.

Swedes Carpet Tacks, Baling Tacks, Canvas Tacks, Cheese-box Tacks, Curtain and Shade Tacks, Broom Tacks, Stamp and Gauger Tacks — Same list as Upholsterers' Tacks

Railroad Tacks, Roofing Tacks, Hide Tacks — Same list as Billposters' Tacks.

Looking-glass Tacks, Picture-frame Points, Truckers Tacks, Berry-box Tacks — Same list as Lace Tacks / Same list as Basket Tacks

Net Extras for Finishing

50-lb. boxes add	$0.75 per 100 lbs
25-lb. boxes add	.90 per 100 lbs.
1-5-10-lb. packages add	1.25 per 100 lbs.
½-lb. packages add	1.75 per 100 lbs.
¼-lb. packages add	2.50 per 100 lbs.
⅛-lb. packages add	3.50 per 100 lbs.

Net Extras for Packing

Wash Tinned add	$2.00 per 100 lbs.
Hot Tinned add	5.00 per 100 lbs.
Wash brass Plated add	2.50 per 100 lbs.
Electro brass Plated add	3.50 per 100 lbs.
Copper Plated add	2.00 per 100 lbs.
Japanned add	2.50 per 100 lbs.
Galvanized add	3.50 per 100 lbs.

Contents of Standard Cases

⅛-pound papers packed in packages of 12 papers (called a dozen), and 100 dozen in a full case lot.
¼-pound papers packed in packages of 12 papers (called a dozen), and 50 dozen in a full case lot.
½-pound papers are not dozened and are packed 100 pounds (200 papers) in a full case lot.
1-pound papers are packed 100 pounds (100 papers) to a full case lot.
All goods are packed only as stated above and are full net weight of the size or kind designated.

Established Lengths of Tacks

All kinds of Tacks excepting Gimp and Lace Tacks

No. 1	1½	2	2½	3	4	6	8
3-16	3½-16	4-16	5-16	6-16	7-16	8-16	9-16 Inch
No. 10	12	14	16	18	20	22	24
10-16	11-16	12-16	13-16	14-16	15-16	16-16	18-16 Inch

Gimp and Lace Tacks

No. 1	1½	2	2½	3	4	6	8
3½-16	4-16	5-16	6-16	7-16	8-16	9-16	10-16 Inch
No. 10	12	14	16	18	20		
11-16	12-16	13-16	14-16	15-16	16-16 Inch		

Prices will be quoted on application for goods not covered by this list.

Increases Capacity

The Central Iron & Steel Co., Harrisburg, Pa., has made a number of improvements at its plant during the past year. It placed in operation a new 100-ton open-hearth furnace, increased the piling space at its No. 1 mill shipping shed 100 per cent, installed a new engine to drive its 89-inch mill, and provided a fuel oil system for all of its mills and open-hearth furnaces.

The Empire Machinery Exchange, 915 Citizens building, Cleveland, has taken over the sale of the surplus equipment of the R. & V. Wagner Engineering Co., Moline, Ill., comprising about $400,000 worth of latest type tools.

Court Upholds Workers' Rights

Federal Judge Enjoins Mayor and Police Chief of Cleveland From Barring Importation of Men to Take Place of Steel Strikers—Declares Workers Were Illegally Arrested and Ordered Out of City

IN AN important decision, expected to have a far-reaching effect, Federal Judge Westenhaver in Cleveland recently granted the American Steel & Wire Co., Cleveland, an injunction restraining Mayor Harry L. Davis and Police Chief Smith of that city from interfering with or barring from the city men brought from other cities to take the place of strikers.

Shortly after the outbreak of the steel strike, which was called during the Cleveland political campaign, Mayor Davis issued an order to bar all those who came to the city to work in steel plants. The men were arrested at railroad depots under the suspicious person ordinance and immediately taken to police stations, where they were given the alternative of leaving the city or serving a term in the workhouse. More than 300 were forced to leave the city.

Complaints of No Avail

Complaints against the city officials were made by the local steel companies and business organizations, but to no avail. Finally the American Steel & Wire Co., applied for an injunction. Judge Westenhaver has just made public his complete decision which says in part:

"The so-called 'suspicious person' ordinance of the city of Cleveland confers no authority in conflict with those settled rules of law. It follows then that the procedure pursued by defendants is illegal and that if a violation of plaintiff's rights therefrom that an injunction should issue.

"The affidavits show that on Nov. 22, 1919, 25 men under contract with the plaintiff were thus arrested; that on Nov. 29, 1919, 22 men were thus arrested, and that on Dec. 3, 1919, 55 men were thus arrested. All of these men were held under arrest for several hours before being released. Of these groups, it seems, all except four eventually entered the employment of plaintiff, and that these four, as a result of the humiliation to which they were subjected by such arrest, or for some other reason, elected to return to their former residences.

"The history of defendants' interference with persons employed by plaintiff, or seeking to enter of their own initiative plaintiff's employment, is not fully covered by the affidavits on file. As already stated, this procedure has been pursued since a few days after the declaration of the strike. On one day, Oct. 16, 1919, some 200 persons came to Cleveland for the purpose of entering the employ, either of plaintiff or of some other manufacturer of steel and iron products. All of these were arrested, detained, investigated and escorted by the police out of the city.

"Other affidavits, filed on behalf of plaintiff, assert that as a result of this procedure, plaintiff has, during the months of October, November and December, lost the services of some 400 men, and that the effect is to make it exceedingly difficult to procure men to operate its several plants. That such is the necessary and reasonable consequence of this procedure seems evident.

"That plaintiff is entitled to relief by injunction in this situation is obvious from a consideration of well settled legal principles. It is engaged in a lawful business and has a right to conduct that business without unlawful interference, either by its striking employes or by any other persons. It may solicit and procure persons to work in its plant, no matter where they reside, or whether citizens of the United States or not. No one may lawfully interfere with this right of plaintiff, and if deprived thereof its property is destroyed.

"This is also equally true of all persons desiring to enter into the employment of plaintiff. To deny any such person that right because he does not live in Cleveland would be to abridge or deny to such person privileges and immunities belonging to every citizen of the United States and protected by its constitution from a denial or abridgment by any state. The protection accorded by the constitution of Ohio is equally sweeping. The power to preserve the public peace and to arrest and prosecute persons for crime cannot be made to support action depriving persons of these constitutional rights and privileges.

Pickets' Rights Outlined

"The courts have uniformly protected and enforced these rights by injunction. The legal principles which support equitable jurisdiction are too well known to require the citation of authority. The question has usually arisen in suits to enjoin unlawful interference by striking employes and their pickets. Employes have ordinarily the right to leave an employment at will unless restrained by contract either singly or in combination.

"They have a right peaceably to persuade others to do likewise and to refrain from taking the places thus vacated. They have no right, however, by violence, intimidation, coercion or threats to prevent the former employer from conducting his business at will, or from seeking and entering the places thus vacated. The rights are at least equal. In all cases in which picketing has been allowed, the courts have not hesitated to restrain or regulate picketing in such a way as is necessary to prevent violence, coercion or intimidation being used against the persons employed or seeking to be employed to take the vacant places.

"Defendants in this hearing seek to give a different meaning to the term 'strike breaker,' but the procedure followed since first adopted shows that the illegal arrest and interference has been with persons whose only offense was taking the place of plaintiff's former employes at the time on a strike. The criminal procedure for arresting and prosecuting for crime is no different when applied to strike breakers, as thus defined, than to any other persons guilty of crime.

"A preliminary injunction will be granted as prayed. Bond in the sum of $2000 will be given before the injunction takes effect. The scope of the injunction should be clear from this opinion, but, in order to prevent misunderstanding a provision may be added thereto in these words: That nothing herein contained shall be taken as preventing the arrest of any person on a warrant duly and regularly issued, nor the arrest without warrant of any person as to whom the arresting officer has information or knowledge reasonably calculated to induce the belief that such person be guilty of felony, nor the arrest without warrant upon view of any person found violating any penal statute of the United States or the state of Ohio, or ordinance of the city of Cleveland."

Handling of Men is Big Science, Says Frank

Isaac W. Frank, who recently retired from the presidency of the United Engineering & Foundry Co., Pittsburgh, was the guest of honor of the Pittsburgh Foundrymen's association, of which he was one of the organizers, at its recent annual dinner held at the Elks' club, that city.

Introduced by C. S. Koch, president of the American Foundrymen's association, Mr. Frank, in a brief talk, declared that the management of men was the problem of the day not only of the foundry interests but of industry in general. Handling of workmen was as much a science today as was the chemistry of iron, he said, and was worthy of as much study; that only by the generous injection of the human element into work by the employers could employers hope for the success that would come to them from happy and satisfied employes and that humanity was the only cure for the inefficiency which

had developed among workmen since the ending of the world war.

Mr. Frank made a stirring plea for a strong fight against the various "isms" of the day and for a better Americanism through the Americanization not only of the foreign but the native born. Efficiency and increased production and not increased wages were the solution of the high cost of living problem, he declared.

The speaker reviewed in interesting fashion the early days of the Pittsburgh Foundrymen's association and the evolution of the foundry industry from the days of the eye test for iron and of hand-mixing and ramming of sand.

At this meeting Brig. Gen. Edgar Jadwin, formerly colonel of the Fifteenth engineers, a Pittsburgh regiment, who recently returned from abroad, gave his experiences both in connection with the prosecution of the war and of his missions in Poland and Ukraine. E. Lowry, United States attorney for western Pennsylvania, spoke of bolshevism, its causes, effects and solution.

The affair was in charge of the entertainment committee of the association, which consists of O. C. Dobson, the Carborundum Co., chairman; C. W. Forcier, Pittsburgh representative of the Crucible Steel Forge Co., Cleveland, and the Exeter Machine Works, Pittston, Pa.; G. A. Bauman, of the Jones & Laughlin Steel Co., Pittsburgh; C. L. Kirk, of the Kirk Supply Co., Pittsburgh, and L. W. Mesta, of the Mesta Machine Co., Pittsburgh. More than 350 were present.

Fight Bolshevism With Motion Pictures

Washington, Dec. 23.—Due largely to the impressions obtained by the senate committee on education and labor in its investigation of the steel strike, a national campaign against the bolshevism and radical tendencies has been initiated here. It grew out of conferences between officials of the government, members of congress and representatives of moving picture interests. The idea to present the campaign through moving pictures, however, was that of Secretary of the Interior Franklin K. Lane and resulted in a resolution adopted by the committees on education and labor of the senate and the house of representatives at a joint session.

Secretary Lane outlined to the moving picture men the seriousness of the present social situation in the United States. He declared no medium for the dissemination of truth regarding Americanism gives so much promise as motion pictures.

Production Stimulated by Bonus System

For the past ten years employes of the Cleveland Crane & Engineering Co., Wickliffe, O., have been given a bonus on July 1 and Dec. 31. Each employe who has not been absent from work more than one day each month during a period of six months, unless hindered by sickness or other causes, receives an amount equal to 2 per cent of his wages for each year he has been in the employ of company. A number of the old employes will receive checks Dec. 31 amounting to 20 per cent of their wages for the past six months. This method has stimulated production. Ten per cent of the men on the payroll have not lost a single day for six months.

Study First-Aid Work

Several industrial companies in the Philadelphia district has taken up first aid work under the direction of the south eastern Pennsylvania chapter of the American Red Cross, 218 West Rittenhouse square, Philadelphia. Among the companies listed are the Philadelphia Electric Co.; the Autocar Co., Ardmore, Pa.; Phoenix Iron Works, Phoenixville, Pa., and the Hoopes & Townsend Co., Philadelphia. Classes for instruction of employes are being held during the working hours, conducted usually by the company's surgeon. It is planned to foster this work in other plants in this district.

First Class Graduates

The first class, numbering 79 foreign-born residents of Bethlehem, Pa., has been graduated from the Bethlehem Americanization school, conducted by J. Mark Frey, secretary of the Lehigh Y. M. C. A., who has conducted Americanization work in Bethlehem for some years. Of the initial class only 30 received certificates, the alloted span of two years between the first and second applications not yet having expired for the others. As this period expires the other graduates will receive their certificates.

The class was addressed by R. A. Lewis, general superintendent of the Bethlehem Steel Co., who spoke on "Co-operation," congratulating the men upon their attainments and urging a closer bond between the men and their employers, the new citizens and the citizens by right of birth. Judge C. A. Groman of the Lehigh county court made it plain that no applicant for naturalization will be considered in his court who shows the slightest trace of bolshevism or anarchism, who belongs to any society which has as its purpose the undermining or overthrowing of the American government, and that any applicant who does not subscribe to some religion must pass a rigid examination in other respects. "The court feels very strongly on those matters," said the judge. "When a man believes in God or in some religion, who is not a bolshevist or an anarchist, and who thinks enough of this country to buy property or who has invested in Liberty bonds, or manifests an interest in the affairs of the country in some other manner, the court is satisfied that that man can be made a good citizen."

LABOR NOTES

The Milton Mfg. Co., Milton, Pa., after an idleness of 10 weeks due to the steel strike has resumed full operation in its bar and puddle mills. The old scale of wages is being paid.

* * *

Peabody & Stearns, Boston architects, are drawing plans for 16 brick, 2-story houses to cost $150,000, for the Draper Corp., Hopedale, Mass., for use of its employes. Bids will be asked for shortly.

* * *

The subject of industrial unrest was discussed at the regular monthly meeting of the New England Foundrymen's association at the Exchange club, Boston, Dec. 10. Frank B. Gilbreth, consulting engineer of Providence, R. I., was the speaker.

* * *

The Ford interests are planning stores to be operated on a co-operative basis for the benefit of employes in Highland park and Dearborn, Mich., and wherever they have manufacturing plants. Stocks are to be composed of foodstuffs, wearing apparel and other necessities.

* * *

The National Stove Founders' Defense association, representing stove manufacturers, has agreed to grant employes an 8-hour working day and a 10 per cent increase in wages. The agreement was made with representatives of the International Molders' union at a conference in Atlantic City, N. J., Dec. 13.

Here and There in Industry

Live Information Which Records the Expansion of Various Lines of Productive Enterprise

THE William H. Haskell Mfg. Co., Pawtucket, R. I., bolts, nuts and screw machine products, has completed plans for the erection of a machine shop, which will be two stories, 80 x 140 feet, and will be utilized for the manufacture of machinery for the firm's own use, as well as bolt and cold punched nut machinery for the trade. The shop will be run with electric power and most of the larger machines will be driven by individual motors. At present the company is in the market for planers, vertical and horizontal boring drills, radial drills, milling machines, millers, shapers, grinders, lathes, etc., as well as equipment for a pattern shop and an amount of machine shop furniture.

* * *

THE Malleable Steel Range Mfg. Co., South Bend, Ind., has about completed a large furnace and equipment for the rust resisting treatment it gives to its polished malleable iron range tops. W. R. Swan is in charge of the work.

* * *

THE American Bridge Co., was the successful bidder for the structural steel for the new artillery drill shed of the Hunt armory, Pittsburgh. Its bid was $75,450 for the 760 tons of steel that will be required. Contract for erection was awarded to Eli Abbott, Pittsburgh, at $28,075.

* * *

ERECTION of a new machine shop at the plant of the Seybold Machine Co., Dayton, O., is practically completed, and installation of machine tools, etc., is expected to be started shortly. These tools are now arriving at the plant. The new building, which is 140 x 242 feet, was erected by the Austin Co., Cleveland.

* * *

WORK has been started at Auburn, R. I., on additions to the present foundry of the Universal Winding Co. The new building when completed will be 150 x 470 feet and will have a capacity for melting 50 tons daily. The equipment will be the most modern obtainable and will be adaptable to all foundry purposes. The present construction includes a building, 159 x 200 feet, on the north end of the present foundry of skeleton frame construction and a building, 50 x 159 feet, on the south end which will be of brick, 2 stories. In addition to this, an office building, 25 x 50 feet, will be built as an ell.

* * *

THE Standard Plunger Elevator Co., Worcester, Mass., which builds elevators and metal planers for the Powell Machine Co., under license, is to increase its operations by making other lines of machine tools. A. Bradley Burgess, general manager of the company, says it is not yet ready to announce its plans.

* * *

THE Reznor Mfg. Co., Mercer, Pa., has under consideration the building of a plant in England to take care of the European demands. The company recently secured the necessary permission for the shipment of gas heaters into Great Britain and a consignment of 5000 stoves shortly will be shipped.

* * *

IMMEDIATE erection of an additional plant which will quadruple its present capacity is planned by the Christopher & Simpson Iron Works Co., St. Louis. The main building of the new plant will be of fireproof steel construction, 135 x 500 feet. The addition will cost $300,000, and the completed plant will cover 22 acres.

* * *

THE Wyckoff Drawn Steel Co., Pittsburgh, began operations at its plant at Ambridge, Pa., on Dec. 16, and on Dec. 18, made its initial shipment of cold finished steel, which amounted to several carloads. The plant has a capacity of 6000 tons of finished steel a month and expects to be running full soon after the turn of the new year.

* * *

POWDERED coal firing systems are being installed by the Quigley Furnace Specialties Co., 26 Cortlandt street, New York, for 43 forging furnaces at the plant of the Standard Forgings Co., Indiana Harbor, Ind. The air transport system, manufactured by the Quigley company, will be installed for transporting the fuel from milling plant to furnace bins, for distances totaling approximately 1600 feet. The company hopes to have the installation in operation early in 1920.

* * *

EXHIBITS of its complete line of electric air compressors, drills, valve grinders, etc., will be made by the Black & Decker Mfg. Co., Towson Heights, Baltimore, at the New York and Boston automobile shows. Its 6-foot air compressor as well as a portable tire inflation outfit, designed for all sizes of tires, will be featured.

* * *

CONTRACTS amounting to $111,000 have been obtained by the American Metallurgical Corp., Franklin Trust building, Philadelphia, for the development of about 200 special machines for the Adwear Process Sole Leather Machine Co., that city. The machines are to be equipped with special electric cartridge units, made by the General Electric Co. to melt the wax and heat the machine parts used in connection with the leather processing. Each machine also will be equipped with individual motor drive. The contract carries an option for the placing of 800 additional machines and entails the taking over by the American corporation of the management and operation of the present plant in Philadelphia of the Adwear Process company until the present order is completed.

* * *

CONSIDERABLE new machinery will be required for an addition to the fireproof, brick and concrete plant and office building of the Minneapolis Heat Regulator Co., Minneapolis. The improvement with equipment will call for the expenditure of approximately $100,000. The general contract has been awarded Pike & Cook, and building operations have commenced, in order that the company may avail itself of the increased facilities at the earliest possible moment. The additional space and machinery will treble the company's manufacturing output, it is claimed and call for the doubling of its working force to 300. The company manufactures heat regulators for hot air furnaces, steam or hot water heaters, gas and steam valves, etc., both for domestic and foreign trade.

Here and There in Industry

Live Information Which Records the Expansion of Various Lines of Productive Enterprise

EQUIPPED with a 25-ton crane and 16 hammers, a 65 x 300-foot addition is being erected at the drop forge shop of the American Forge & Machine Co., Canton, O. The hammers range in size from 2000 to 8000 pounds. The work is being done by the American Construction Co., Cleveland, and the Canton Bridge Co., Canton, O., was awarded the structural contract. A power plant, equipped with five 500-horsepower boilers is being installed and the exhaust steam from the hammers will be used to operate the turbine. Coal and ashes will be handled by automatic carriers.

* * *

CONSTRUCTION of the new Liberty tunnel through the south hills at Pittsburgh, contract for which has been awarded to Booth & Flinn, Ltd., Pittsburgh, will start soon. It it largely a concrete job and will require only about 1100 tons of steel.

* * *

TO PROVIDE additional capacity to care for increased business, the Melling Forging Co., Lansing, Mich., recently increased its capital stock. According to J. R. Whitney, secretary and treasurer, new equipment has been contracted for and erection of an addition is under way.

* * *

IN ORDER to care for a large increase in the volume of its business, the Detroit Ice Machine Co., 103 Marquette building, Detroit, recently increased its capital. At the present time the company does not plan to install any large amount of additional machinery, but is purchasing small amounts from time to time.

* * *

THE Mascot Stove Mfg. Co. has obtained a lease on the old foundry of the American Brake Shoe & Foundry Co., Chattanooga, Tenn., and is remodeling the plant into a modern stove foundry, J. F. James who is president and general manager of the stove works, announced recently. The foundry has not been in use for about two years. The brake shoe company erected a new plant at Chattanooga a short time ago. The new foundry will be put in operation by Feb. 1. The capacity of the stove works will be trebled.

* * *

CONSTRUCTION of an addition to the plant of the Milwaukee Auto Engine & Supply Co., Milwaukee, is progressing, and when completed will be utilized for the manufacture of automobile accessories. The building is 120 x 120 feet, with a sawtooth roof. New equipment of a special kind will be added gradually.

* * *

AT ITS annual meeting the Economic Machinery Co., Worcester, Mass., elected the following officers: President, Daniel W. Gurnett, Boston; vice president and general manager, Herman Stake; treasurer, Edward B. Moor; clerk, Arthur W. Santry; directors, D. W. Gurnett, Herman Stake, George A. Putnam, Carl Bonney and Edward B. Moor.

* * *

THE Carter Sheet Metal Co., Omaha, Nebr., is erecting a factory building, 1-story, 132 x 162 feet, which will be used for the manufacture of sheet metal products. In addition to the firm's present equipment, it will install a heavy square shear, corrugating rolls, heavy press, elbow machinery, heavy rolls, double seamers, heavy wedge and other small equipment.

* * *

THE Billings & Spencer Co., Hartford, Conn., voted at a stockholders' meeting, Dec. 16, to increase the capital stock from $750,000 to $1,000,000, the proceeds from which will be used for the building and equipping of an addition to its present factory which will cost the full $250,000. The company also plans to erect a 4-story office building addition which will have a frontage of 75 feet.

* * *

THE R. J. Dowd Knife Works, Beloit, Wis., is erecting an addition to its machine shop which, when completed will be equipped with grinding machinery and other machine tools. According to G. A. Dowd, the building is not expected to be ready for occupation for three or four months, due to the delay in obtaining steel. It will be of fireproof construction, of steel, cement and brick.

* * *

THE Tabor Mfg. Co., Philadelphia, recently moved into its new plant at State road and Devereaux street, where it is erecting an addition, 100 x 108 feet. According to H. W. Brown, secretary, the company will be in the market for machine tools in the near future, and now is preparing a list.

* * *

FORMERLY occupied by the Wolverine Tube Co., the 100 x 120-foot building at Thirty-third and McGraw streets, Detroit, has been acquired by the Continental Tool Works, which will commence the manufacture of cutter blades, cutters and special tools, etc., about Jan. 1.

* * *

CONTRACTS for the erection of a large addition to the plant of the Chicago Malleable Castings Co., West Pullman, Ill., have been awarded, and the building when completed, will increase the tonnage output of the plant about 40 per cent. Orders for new equipment, including tumbling barrels, core ovens and molding machines, have been placed. The building is to be ready for occupation by Feb. 1.

* * *

BECAUSE its business has rapidly increased, the Smalley-General Co., Inc., Bay City, Mich., machinery builder, has found it necessary to increase its capital from $50,000 to $525,000. The new stock all has been paid in for purposes of plant and facility expansion and the company has no bonded, mortgage or other funded indebtedness. The company's official personnel remains as follows: John W. Eddy, of the Skinner-Eddy Corp., Seattle; James G. Eddy of the Ferry-Baker Lumber Co., Everett, Wash.; R. B. Eddy of the Eddy Investment Co.; Howard F. Smith of the Michigan Pipe Co.; and J. R. Decker, sales manager of the Smalley-General Co., all of Bay City, Mich. Mr. Smith also is affiliated with the Dominion Sugar Co., Chatham, Ont. The company intends to devote an increased measure of attention to thread milling.

Edge Bill Offers Export Hope

Passage of Much Discussed Measure Clears Way for Foreign Trade in Opinion of Many Bankers—Some Believe Situation is Beyond Act's Aid—Education of American Investors Need—General Financial News

BY JOHN W. HILL, FINANCIAL EDITOR

FINAL enactment of the Edge foreign trade financing bill has opened up a flood of discussion respecting the probable efficacy of this much talked of measure as a corrective and stabilizer of the alarming foreign exchange confusion. A strong conflict of opinion exists on the point among foremost financial authorities in the country, some contending that the situation is beyond the help of the new act, while others believe that its passage has cleared the way for comprehensive foreign financing and rehabilitation of Europe's shattered economic structure by means of American goods and credits. Time and practical results alone will show which of these views is correct.

Will Encourage Organization

The Edge law, which actually is in the form of an amendment to the federal reserve act, authorizes the organization of corporations of not less than $2,000,000 capital for the purpose of facilitating exports through the purchase of bills of foreign importers. Against these bills will be issued debenture bonds which will be offered to American investors. These debentures will be eligible for discount purposes at the federal reserve banks. The law limits the aggregate amount of outstanding liabilities of any one corporation to 10 times the total of its capital stock.

The feeling prevails among some critics that the law is too replete with restrictions and that the freedom of action essential to the highest success in foreign trade financing is not permitted. One instance of this is found in the inclusion of the Clayton act provision against interlocking directorates, preventing directors of a private banking institution from becoming directors of a national banking organization. This will operate to bar directors of those large institutions operating under state charters a number of which have branches all over the world, from acting as directors of Edge act corporations. In defense of the restrictions, however, legislators declare they have endeavored to devise safeguards for the corporations which would inspire confidence of the public and make possible widespread distribution of the debentures.

After all, the ultimate success of the law will depend upon the investing public's attitude toward securities issued under its provisions. It is foreseen that this presents the greatest difficulties in the way of meeting the foreign credit needs. Recent attempts to float foreign securities in this country have met with a cold reception from investors. This is due partly to the fact that they have never been educated to place their funds outside of their own land, and partly to distrust of, and indifference toward, European recovery.

It is widely recognized, therefore, that no matter what the details of financing export credits may be the chief basis for success will be a vigorous campaign of education or propaganda. The burden is too large for the financial institutions to carry it alone and at the same time take care of the domestic credit needs, and it will be necessary for the bulk of the advances abroad to come out of the savings of the investing public. Those who think well of the Edge bill as a vehicle for raising these credits consider that the favorable publicity it has already received, and the fact that corporations based upon it will be under the general supervision of the federal reserve board, should advance the debentures in the favor of investors and attract funds that otherwise might be timid were the corporations of a different character.

The opinion is growing stronger every day among keen students of affairs that nothing less than a nationwide drive along the lines of the liberty loan campaigns will suffice to awaken the public to the urgent needs of making it possible for Europe to recover, both for Europe's sake and for America's, where export trade is menaced by the demoralized exchange rates. Possibility of this was hinted by Eugene Schneider, head of the French mission to the international trade conference at Atlantic City, upon his return to France last week. He said his country would need to buy $600,000,000 worth of food and fuel and raw materials in America next year, and that in order to raise the credits the United States government would loan its liberty bond campaign machinery. Washington has not admitted that there is any such understanding but nevertheless many believe that anything short of this will result in failure.

The law provides that the reserve board shall prescribe the regulations for the corporations to conform with the act and the board's general counsel is at work upon the preliminary draft. Immediately following the holidays the reserve board is expected to begin conferences with bankers respecting the subject and definite regulations will be promulgated. No steps will be taken to effect any organizations until after the board has laid down its rules.

Will Seek Foreign Trade

In the meantime, however, the national committee on financing Europe organized under the auspices of the international trade conference and the United States chamber of commerce and composed of a number of leading American bankers is holding frequent conferences with manufacturers and industrial interests respecting the possibilities of organizing corporations under the Edge law. Members of the committee are scattered throughout the country for the purpose of extending knowledge of conditions affecting foreign commerce and to evolve suggestions which may prove of benefit in financing continued export business. It is being urged upon interests concerned in maintaining exports that it is to their prime advantage to participate in credit arrangements. In New York efforts are being made to underwrite $1,500,000,000 of foreign trade obligations already outstanding and it is probable that the Edge law will point the way to consummate this gigantic deal. It must be remembered that Europe has been buying largely from this country in recent months on credits arranged between buyer and seller and it is desirable that this sum, estimated at $3,000,000,000 be funded until such time as exchange rates improve. Much thought is being devoted to the point of whether better results would be obtained from organizing one great dominating corporation with many millions of capital or a number of smaller ones. The best opinion seems to favor the big corporation which would permit concentration of efforts and propaganda campaigns.

It would be folly to suppose that even generous credits advanced under the Edge bill would work an immediate miracle of completely repairing the ex-

changes. It would improve sentiment but so long as European printing presses continue working overtime turning out additional reams of inflated currency, the confidence of the world cannot be regained.

Pay $256,459,000 Toward Liquidating Contracts

Washington, Dec. 23.—Contracts liquidated by the war department to Dec. 6 include 18,223 formal ones, valued at $1,215,315,000, and 4695 informal, valued at $919,328,000. It has cost $256,459,000 to liquidate these contracts. In addition, partial payments in liquidation amounting to $85,105,000 have been made on other contracts, making the total amount paid in liquidation $341,564,000. The number of contracts suspended totals 27,837, valued at $3,870,945,000, leaving 4919 remaining to be liquidated, and of the latter the value of 2205 is known and amounts to $1,736,302,000. Ordnance contracts constitute 70 per cent of this amount, air service contracts 22 per cent. and contracts made by the director of purchase, 6 per cent. Assuming that future liquidation can be effected at the same rate of cost as obtained in the past, the cost of liquidating these 2205 contracts may be estimated at $232,960,000.

The saving effected by liquidation amounted to $1,878,184,000. Of this, $1,090,002,000 was saved on formal contracts and $788,182,000 on informal.

Rolls-Royce Buys Plant

The Wire Wheel Corp. of America, East Springfield, Mass., has been purchased by the Rolls-Royce of America, Inc., for use as the American branch of the British automobile concern. As soon as machinery is installed soon after the first of the year production expected to reach 400 chassis in 1920 will be started. The officers of the corporation are: President, L. J. Belnap, Montreal; vice president, Ernest A. Claremont; chairman and managing director, Claude Johnson; treasurer, H. C. Beaver, Springfield, Mass.; directors, L. J. Belnap, Charles E. F. Clarke, J. E. Aldred, Henry J. Fuller, Kenneth K. MacKenzie and Joseph Skinner, Holyoke, Mass.; engineer-in-chief, F. Henry Royce; production manager, M. M. Olley.

Murray Ohio Co. Formed

The Murray Ohio Mfg. Co., Cleveland, is offering for sale $500,00 of 8 per cent cumulative preferred stock and 10,000 shares of common stock no par value. The company is a subsidiary of the J. W. Murray Co., Detroit, producer of hoods, fenders, tanks and general sheet metal parts for automobiles. The Ohio company is being established to take care of the parent company's business in that state. A plant has been leased and is now in operation. The parent company which guarantees the dividends and sinking fund upon the preferred stock has total assets of $2,032,45 and its sales have grown from $933,944 in 1913 to $4,082,437 estimated for 1919.

Financial Crop Ends

STOCKHOLDERS of the American Bosch Magneto Co., have authorized an increase in the company's capitalization from 60,000 shares of no par value to 100,000 shares of no par value. Directors of the company are authorized to issue 20,000 shares of the new stock within six months and from time to time, not to exceed 5000 shares for the benefit of employes. It may be subscribed by employes and stockholders at $100 a share.

* * *

The H. R. Lewis Tool & Supply Co., Detroit, has been purchased by the F. R. Fortune Tool & Mfg. Co., Wooster, O., and plant equipment moved to that city. The new capital stock is $200,000. R. K. Evans is works manager.

* * *

Paul O'Connell and others, of New Haven, Conn., have purchased for $22,000 the assets and good will of the Yankee Tool Corp., Bridgeport Conn., and will remove the business to New Haven. They will add to the equipment and continue production on a larger scale than heretofore.

* * *

The Van Dorn Iron Works, Cleveland, has amended its charter placing common stock upon a no par basis. The new capital will consist of $2,000,000 of preferred stock of which $650,000 has been sold and 100,000 shares of common stock of which 80,000 shares will be offered for sale.

* * *

The Grant Motor Car Co. has offered for sale $500,000 of 6 per cent gold notes sold to yield from 7 per cent to 7¼ per cent. The company announces that its present capacity of 15,000 cars a year is being increased to 20,000 cars and that contracts for 17,000 cars have already been let. Total net assets of the company are $2,482,629 and net earnings over the last three years have averaged $182,836 per year.

* * *

Stockholders of the Edward G. Budd Mfg. Co., manufacturer of "all steel" automobile bodies, have approved an increase of $2,000,000 in the 8 per cent preferred stock of the company, bringing the total amount authorized up to $4,251,700. Of the new stock $1.000,000 has been purchased by William A. Read & Co., Brown Brothers & Co., and Frazier & Co., who are offering it for subscription at 99 and accrued dividend. This brings the total amount of the issue outstanding to $3,251,700.

Rising Prices

Continue on Some Coal Tar Products —Ammonium Sulphate Short

New York, Dec. 22.—Advancing one-half cent, prices on naphthaline flakes are now holding at a range of 7 to 8 cents, on both spot and contract business. Naphthaline balls, however, continue to be quoted at the old range of 8½ to 9½ cents. The increase in flakes is due to a steadily improving demand from the drug trade and dye industry, which has resulted in a great shortage of supplies.

A marked scarcity is also noted in sulphate of ammonia, a development which is restricting trading considerably. Contract buying, as a result, is negligible, and export business is being turned away in large volume. Spot business for domestic account also is being materially affected, and what little nearby ammonia is available is moving at advancing prices around $4 per 100 pounds, f.o.b. producers' plants; contract business is purely nominal. A factor in the present shortage of sulphate of ammonia is the large curtailment in production as a result of the coal scarcity.

Although a heavy demand continues for benzol, prices have undergone no further advance, holding at 27 to 31 cents, f.o.b. producers' plants. Ninety per cent benzol is quoted at 23 to 25 cents. Toluol and solvent naphtha is quoted at 28 to 32 cents and 22 to 27 cents, respectively. Demand for this latter product is said to be especially active, due to buying of the rosin manufacturers.

Coke Oven By-Products

Spot

Per Gallon at Producers' Plants

Pure benzol	$0.27 to .31
Toluol	.28 to .32
Solvent naphtha	.22 to .27

Per Pound at Producers' Plants

Phenol	nominal
Naphthalene, flake	0.07 to .08
Naphthalene, balls	0.08½ to .09½

Per 100 Pounds at Producers' Plants

Sulphate of ammonia	$4.00

Contract

Pure benzol	$0.27 to .31
Toluol	.28 to .32
Solvent naphtha	.22 to .27

Per Pound at Producers' Plants

Phenol	nominal
Naphthalene, flake	0.07 to .08
Naphthalene, balls	0.08½ to .09½

Per 100 Pounds at Producers' Plants

Sulphate of ammonia	nominal

The National Education association will hold an exhibit in Cleveland during the week of Feb. 23.

Equipment Sellers Hail Jan. 1

Expect Present Lull to be Superseded by Heavy Buying Movement After Holidays—Hammers and Fabricating Equipment Sell Readily—Much Crane Business Pending—Canadian Dealers Active Despite High Prices

HOLIDAYS usually bring a lull to the machine tool and equipment market and this is particularly true at the year-end when they accompany inventory-taking time. While this year is no exception and a falling off in inquiries and orders is noted in practically every selling center, most dealers report satisfactory sales sheets, made up of small orders and are not complaining. They anticipate large orders after Jan. 1.

Activity among users of hammer and forging equipment is particularly marked in Cleveland, one large inquirer being the Steel Improvement & Forge Co., Cleveland. In that city as well as Chicago, most of the orders taken are for one or two tools. Deliveries are receding further and further into the future and one maker of automatic screw machines has sold his entire output for 1920.

Fabricating equipment occupies the center of the stage in the eastern territory. The American Car & Foundry Co. bought $200,000 worth of machine tools including 30 or 40 fabricating machines for its various plants. The Magor Car Co., Passaic, N. J., bought $90,000 worth of this type of equipment. The American Locomotive Co., New York, is buying a larger quantity for its various plants.

Smaller purchasers include the Lycoming Foundry & Machine Co., Williamsport, Pa.; High Speed Tool Corp., Green Island, N. Y.; Coldwell Lawnmower Co., Newburg, N. Y.; Mergenthaler Linotype Co., Brooklyn, N. Y.; Westinghouse Airbrake Co.; Pittsburgh, and the Standard Oil Co., Bayonne, N. J. Sizable lists are expected in New York soon from the Westinghouse Electric & Mfg. Co., East Pittsburgh; Rolls-Royce of America, Inc., Springfield, Mass.; Virginia Railway & Power Co., Norfolk, Va., and Billings & Spencer Co., Hartford, Conn.

Crane sales and inquiries mostly are for one or two units. The Westinghouse Electric & Mfg. Co., however, is to close on 14 overheads for Lester, Pa., and the Union Shipbuilding Co., Baltimore, will buy 12. Revised bids now are in on 22 cranes for Follansbee Bros. Co., Toronto, O., and the order probably will be placed before Jan. 1. The Carpenter Steel Co., Reading Pa., and the New York Shipbuilding Corp., Camden, N. J., each are in the market for two cranes, and a Canadian steel company is understood to be ready to close on 16 cranes.

Canadian sellers likewise are active and expect to be so in increasing measure after Jan. 1, when many building programs will come to a head. High exchange rates have sent prices on American-made machinery skyward, some prices now being 50 per cent over those quoted a few months ago. Price seems of secondary consideration, however, and deliveries are the main factor. Some Canadian inquirers are: The 1900 Washer Co., Toronto; Buhl Stamping Co., Walkerville, Ont., and the Piano Cases & Phonographs Co., Ltd., and Brantford Computing Scale Co., both of Brantford, Ont.

Heavy Buying in East Marks Year's Closing Period

SUBSTANTIAL buying characterizes the eastern machine tool market. A number of small orders are being placed, and at the same time, action is being taken on several sizable lists. The American Car & Foundry Co. has begun to close on approximately $200,000 worth of machine tool equipment, including 30 to 40 fabricating machines. The equipment is to be alloted among its Buffalo, Chicago, Depew, N. Y., and Milton, Pa., plants. The Magor Car Co., Passaic, N. J., has purchased approximately $90,000 worth of machinery, including considerable fabricating equipment. The American Locomotive Co., 30 Church street, New York, is buying machine tools for Montreal, Chester, Pa., Dunkirk and Schenectady, N. Y. The company contemplates issuing additional inquiries within the next week or 10 days. A number of fabricating tools are to be included.

Included in the number of smaller purchasers are: The Lycoming Foundry & Machine Co., Williamsport, Pa., which bought 8 or 10 miscellaneous machine tools. The High Speed Tool Corp., Green Island, N. Y., which closed on a list of tool room equipment. Another buyer of the past week has been the Coldwell Lawnmower Co., Newburg, N. Y., which took several miscellaneous machines. The Mergenthaler Linotype Co., 44 Ryerson street, Brooklyn, N. Y., likewise has been a buyer of a small list of machine tools. The Standard Oil Co. of New Jersey has purchased two friction saws for Roumania, and a heavy shear for Bayonne, N. J. Additional buyers of fabricating equipment have been the New England Iron Works, New Haven, Conn., and the Union Mfg. Co. and the Standard Boiler Works, both of Lebanon, Pa. Buying in each instance was confined to one or two machines. The Westinghouse Airbrake Co., Pittsburgh, has placed orders for machine tools in the East for its plant in that city. The Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa., is expected to be in the market shortly for a number of machine tools. While this company is inquiring for 12 overhead cranes for its new turbine plant at Essington, Pa., it has not, so far as can be learned, issued a list of machine tool requirements.

Another prospective buyer of machine tools is the Rolls-Royce of America, Inc., which has just recently an-

Chrome Magnet Steel

Heating *Ludlum High Speed Steel Ingots* for rolling means something more than simply getting them hot. It means that the temperature must be brought up gradually to the desired point. If it is brought up too quickly, certain stresses and strains occur which cause fractures.

One reason why Ludlum Steels are consistently uniform is because of the care taken by our ingot heating teams.

Ludlum Steels have been selected by the majority of large users and twist drill and milling cutter manufacturers, as the steels best suited for their purposes.

Ludlum Steel Company

General Office and Works
WATERVLIET, N. Y.

Branch Offices:

Chicago, Cambridge, Mass., Detroit, Buffalo, New York City Cincinnati, Cleveland, Philadelphia, Pittsburgh

nounced the purchase of the plant of the American Wire Wheel Co., Springfield, Mass. Action is expected shortly. An interesting development of the past week in the automobile field is the merger of the Mercer Motors Co., Trenton, N. J., and the Locomobile Co. of America, Bridgeport, Conn. The latter company, it is reported will be known as the Locomobile Co. and will devote a portion of its capacity to the production of medium-priced pleasure cars and ¾ to 5-ton commercial trucks. Whether or not the capacity of the Bridgeport plant will be greatly enlarged is not known; the Mercer plant at Trenton, however, practically will be doubled. It is stated that approximately $650,000 will be expended. The Virginia Railway & Power Co., Norfolk, Va., will expend $1,130,000 for equipment and other improvements in that city. The Billings & Spencer Co., Hartford, Conn., plans an outlay of $250,000 for a plant addition, including equipment. Congress has authorized the purchase by the government of the Curtiss-Elmwood plant at Buffalo for $1,804,300.

Foremost among inquiries of the past week in the eastern crane market is a list of four cranes, from two to 50 tons in capacity, for the Lester, Pa., plant of the Westinghouse Electric & Mfg. Co. The inquiry has been issued through the Pittsburgh office. Additional inquiries include two 10-ton electric cranes, with 42-foot and 68-foot spans respectively, for the Carpenter Steel Co., Reading, Pa. Moses, Pope & Trainer Inc., 356 Fifth avenue, New York City, want a small locomotive crane. The Piedmont-Mt. Airie Auganis Co., Baltimore, fertilizer manufacturer, wants an overhead electric crane. The New York Shipbuilding Corp., Camden, N. J., is in the market for two 5-ton gantry cranes of 40 and 56-foot span respectively. The Midvale Steel & Ordnance Co., Philadelphia, is inquiring for a 5-ton electric crane, with 69-foot span, for Coatesville, Pa.

Included in awards of the past week is a 10-ton electric crane, with 90-foot span, for the Magor Car Co., Passaic, N. J., to the Whiting Foundry & Equipment Co., Harvey, Ill. The Delaware, Lackawanna & Western railroad has placed an overhead crane with the Cleveland Crane & Engineering Co., Wickliffe, O. The Belmont Iron Works, Philadelphia, has placed a 30-ton locomotive crane with the Orton & Steinbrenner Co., Chicago. Another 30-ton locomotive crane has been placed by the Standard Oil Co. for Bayonne, N. J. The Sligo Iron & Steel Co., 42 Broadway, New York City, bought a 15-ton locomotive crane. It is understood that the Toledo Bridge & Crane Co., Toledo, O., has been awarded list of 12 electric cranes for the Union Shipbuilding Co., Baltimore.

Action is expected very shortly on the list of approximately 12 overhead cranes for the American Car & Foundry Co. The International Motors Co., New Brunswick, N. J., and the Todd Shipyards, 15 Whitehall street, New York City, both in the market for 5-ton overhead cranes, are understood to have postponed action until after the first of the year. The Albany Building & Supply Co., Albany, N. Y., has temporarily withdrawn its inquiry for a 10-ton overhead electric crane. Contrary to current reports, the American Locomotive Co., will not be in the market for cranes within the near future. The Export and Import Board of Trade, Baltimore, has formulated a plan which provides for a loan of $50,000,000 for the construction of modern municipal piers and warehouses.

Chicago Dealers Active Despite Lull

DEALERS in machine tools in the Chicago district have no complaint whatever to make as to the volume of business now being offered although the usual holiday and preinventory lull is somewhat in evidence. Most business now consists of small orders and single tools. A matter of interest, which is not really expected to yield actual business, is renewed activity on the part of the Chicago, Burlington & Quincy railroad, which is obtaining revised quotations on the large list put out several months ago. With the probability of railroads returning to their owners Jan. 1 becoming more remote, it is scarcely believed the road will be able to buy. It is expected the aircraft production board will resume selling government-owned machinery shortly after the first of the year.

Deliveries on most tools average at least 90 days with some lines much further delayed. One builder of automatic screw machines has sold his entire output for 1920 and some deliveries will run into 1921. The E. J. List Mfg. Co., at Havana, Ill., is building an addition and will purchase equipment.

Sizable Crane Business Booked and Pending in Pittsburgh

TWO big crane inquiries are expected to be closed in the Pittsburgh district shortly. These are the 14 overheads for the new plant of the Westinghouse Electric & Mfg. Co. at Lester, Pa., and the 12 wanted for the Union Shipbuilding Co., Baltimore. The latter being a subsidiary of the McClintic-Marshall Co., Pittsburgh, the awards will be made from the offices of that company, while all purchases for the Westinghouse company are placed from the main offices in East Pittsburgh. All revised specifications on the 22 cranes wanted for the new plant of the Follansbee Bros. Co., Pittsburgh, at Toronto, O., are understood to be in and an award of this business is looked for before Jan. 1. The Pittsburgh Plate Glass Co., is erecting a new plant at Kokomo, Ind., Stone & Webster, having the contract. A 20-ton crane is wanted for this plant. The Alliance Machine Co., Alliance, O., has been awarded a 15-ton trolley crane for the Vandergrift, Pa., plant of the United Engineering & Foundry Co., Pittsburgh. A large Canadian steel company, which has under construction a new rail and structural mill, is understood to have closed in Pittsburgh for 16 cranes and other equipment. The Allis-Chalmers Mfg. Co., West Allis, Wis., recently took the contract for the equipment for the plant of the Bessemer Limestone Co., Youngstown, O., which includes seven mills, three each, kilns and coolers, as well as driers, rolls, nine motors and two motor generator sets, the order approximating $500,000.

Small machine tools are in steady demand, but few lists are coming out. Most makers of such tools and equipment are sold at least to Feb. 1, and some well through the first half of 1920.

Trading Slack as Year Approaches End

USERS of machine tool equipment who supply their needs in the Cleveland market, apparently are taking advantage of the holiday period to postpone purchases. Inquiries have dropped off considerably and only those orders are being placed which represent badly needed equipment. In connection with steam drop and forge hammers, however, the situation differs slightly; for these the demand is particularly active. Users anticipate a sharp advance Jan. 1, and are endeavoring to place their orders at the present market. Many request that delivery be deferred until April or May, whereas makers are able to deliver in eight to 10 weeks. Such attractive delivery dates, however, do not apply to regular machine tools where makers are able only to make shipment within three to six months.

One of the larger companies to be in the market for hammers, is the Steel Improvement & Forge Co., Cleveland. It is receiving quotations on 3000, 2500, 2000 and 1500-pound standard steam drop hammers. New equip-

STEEL CASTINGS
Farrell-Cheek Steel Foundry Co.
"Makers of Steel Castings that are a little better than the next best."
Sandusky Ohio
F.C.

ment is being ordered by the Atlas Drop Forge Co., Lansing, Mich., for a new addition. The American Forge & Machine Co., Canton, O., recently was in the market for hammers, but is understood to have closed with an Alliance, O., maker, on its entire needs.

Several dealers in other cities are endeavoring to locate their customers' requirements through Cleveland dealers. These include Ogden R. Adams, Rochester, N. Y., who wants one 5/8-inch automatic, one 30-inch vertical boring mill; one 24 or 40-inch slab miller with 8-foot bed; one 18-inch x 12-foot heavy duty lathe for rough turning axles and shafts. Howard B. Payne, Pittsburgh, another dealer, wants one 11-inch vertical boring mill for a customer in the West. Homer Strong, Syracuse, N. Y., machine tool dealer, is endeavoring to locate several gear shapers.

No particularly large list of tools is extant at the present time, although several are pending. These include one from the Foote-Burt Machine Co., Cleveland, and another from the Marsh Motor Car Co., which is moving from Massachusetts to Cleveland and has a temporary office in the Hotel Cleveland. The former concern has closed on much of its crane equipment but since its business has increased rapidly, it is believed that it will not dismantle plant No. 1, in which event its machine tool needs will be even larger than at first anticipated. While the Marsh company is understood to be moving 15 or 20 carloads of equipment from its former plant, it now is receiving bids on considerable special machinery.

Among the smaller inquiries is one from the Advance Machinery Co., Van Wert, O., which wants one 42 x 42-inch x 10 to 14-foot planer; one 36 x 36-inch x 8 to 10-foot planer; one 4, 5 or 6-foot radial drill. The Rummell Mfg. Works, Findlay, O., wants a universal tool grinder and a small milling machine, not back-geared. The Manhattan Electrical Supply Co., Ravenna, O., is in the market for one Peck, Stowe & Wilcox No. 0230 series A, with holding attachment, capacity 16 gage, 30-inch cutting blade. The Alloy Parts Mfg. Co., Canton, O., wants a 14-inch disk grinder. The U. S. Mfg. Co., Ontario, Oreg., remains in the market for 10 or 12-foot bending rolls for 1/4-inch or lighter, one 10 or 12-foot squaring shear for 3/16-inch or lighter; one 10-foot power brake for 3/16-inch or lighter and one power or hand angle iron shear.

One Canadian steel company is understood to be closing for approximately $3,000,000 worth of cranes and mill equipment. The Arctic Ice Machine Co., Canton, O., shortly will be in the market for two 15-ton cranes as well as machine tool equipment for an erecting shop 140 x 400 feet. It recently bought a quantity of machine tools for its new machine shop. The Buckeye Traction Ditcher Co., Findlay, O., wants a 5-ton traveling crane for its new building.

Canadian Machine Tool Prices Increased

MANY industrial plants and additions at present under way and proposed for early in 1920 are expected greatly to increase the demand for machinery and machine tools in Canada. Present demand appears to be in excess of supply and dealers continue unable to promise delivery in many standard lines inside of six months. Several Toronto dealers were informed this week that prices have advanced in some lines, another 10 per cent. Such price advances on American tools when shipped into Canada show an advance of about 50 per cent over prices quoted a few months ago, on account of the high duties and the exceptionally high rate of exchange which has been holding in regard to Canadian currency in the United States, since dealers in American machinery and tools have been forced to add the difference between the Canadian and American dollar to the price of the tool. However, the price is of secondary consideration, the main feature being deliveries.

Numerous inquiries for tools are being received. The 1900 Washer Co., 489 King street, west, Toronto, is in the market for a 20-inch, 4-spindle drill, power speed, back geared. The Taylor-Forbes Co., Ltd., Guelph, Ont., is building an addition 70 x 100 feet to its foundry and will install considerable new machinery. The Federal Cement Co., Owen Sound, Ont., will improve its plant and install new machinery. The Buhl Stamping Co., Detroit, has secured a lease for five years on the premises of the Hiram Walker Cooperage Co., Walker road, Walkerville, Ont., and will install presses, etc., for the manufacture of its products for the Canadian market. The Piano Cases & Phonographs, Ltd., Brantford, Ont., will build an addition and install automatics, etc., to double its present capacity. The British American Brewing Co., Ltd., Windsor, Ont., is building a bottling shop, 70 x 140 feet, in which $75,000 worth of machinery will be installed.

Construction and Equipment

Concise and Timely Business Building Opportunities from the Field of Industry

Among New England Plants

BATH, ME.—The Watson Frye Co. is turning down business on account of lack of capacity and extensions are looked for soon.

KITTERY, ME.—The E. C. Safechain Co. has been incorporated with $250,000 capital to manufacture automobile accessories. Frank K. Cole is president.

PORTLAND, ME.—The National Oil Transport Co. has been incorporated to build barges, ships, etc., with $1,000,000 capital by R. I. Johnson, H. I. Smith and A. B. Farnham.

WOODSTOCK, ME.—The Peoples Light & Power Co. has been incorporated with $10,000 capital by Mark C. Allen, Thomas W. Gorden and Ned I. Swan.

DOVER, N. H.—The National Wood Working Co. will build a 1-story machine shop.

BOSTON.—The Webber Carburetor Co. has been incorporated with $400,000 capital to manufacture carburetors. Harold E. Clark is president and other incorporators are James L. Doyle and George E. Richardson.

BOSTON.—The Premier Register Table Co. has been incorporated to make tools, mechanical devices, etc., with $100,000 capital by Elbert L. West, James West and William E. Ludden.

BROCKTON, MASS.—The Eagle Motor Co. has been incorporated with $50,000 capital to manufacture motor vehicles.

CAMBRIDGE, MASS.—The Lever Bros. Co. has had plans drawn for a power plant.

CAMBRIDGE, MASS.—Charles N. James, 414 Main street, has had plans prepared for a machine shop, 1-story, 125 x 150 feet, to cost $35,000.

EAST SPRINGFIELD, MASS.—The Storms Drop

U. S. Railroad Administration installation—typical of KREODONE service—90,000 sq. ft. in this one shop.

Kreodone EVERLASTING Wood Block Floors

Crushing weight, cutting contact, splintering shocks, oil drip and general heavyweight abuse—these are some of the factors which quickly establish the service-worth of a floor in a railroad shop.

In the above pictured shop, the U. S. R. R. Adminstration installed 90,000 sq. ft., of our KREODONE wood block floor because of its characteristic ability to absorb punishment—and "come up smiling."

Only the tough steel-fibre-like KREODONE Block, made of selected long-leaf yellow pine and saturated with our special PURE creosote oil, makes possible real service under the above named hard conditions.

And note—KREODONE Blocks do *NOT* bleed tar. Doesn't that mean something to you who are in the market for an honest-to-goodness factory floor?

Write us. Let us give you good, logical, convincing reasons why YOU should put KREODONE into your specifications.

Forging Co. has purchased five acres and will erect a factory.

FITCHBURG, MASS.—The Simonds Mfg. Co. has let the contract for a 5-story, 60 x 100-foot storage warehouse.

HOPEDALE, MASS.—The Draper Corp. is having plans drawn for 16 houses which it plans to build for its employes.

NATICK, MASS.—The Northway Motors Corp. has let the contract for a 2-story, 70 x 202-foot factory addition, to cost $75,000.

NEW BEDFORD, MASS.—The William Whitman interests have let the contract for a 3-story, 188 x 688-foot mill, office building, picker house and power plant to cost $1,500,000.

PITTSFIELD, MASS.—The General Electric Co. has let a contract for a 1-story, 100 x 300-foot wire enameling building to cost $100,000.

SPRINGFIELD, MASS.—The Cheney Bigelow Wire Works contemplates an addition to be devoted to wire weaving.

SPRINGFIELD, MASS.—Rolls-Royce of America, Inc., has announced the purchase of the former plant of the American Wire Wheel Co.

SPRINGFIELD, MASS.—Bids close Jan. 5 for a 1-story, 50 x 60-foot addition to tho office building of the Moore Drop Forging Co.

TAUNTON, MASS.—Bids closed Dec. 18 for a 1-story, 80 x 206-foot plant for the General Electric Co. in Weir village.

WATERTOWN, MASS.—The Watertown Press Steel Co. has been incorporated with $150,000 capital by Arthur E. Quilty, William H. McDonald and William S. Murray.

WORCESTER, MASS.—The Simplex Piano Action Co. has purchased a tract of land on which it intends to build a factory.

WORCESTER, MASS.—The Standard Plunger Elevator Co. has plans for extensions and the addition of new lines of machine tools.

WORCESTER, MASS.—Lockwood, Greene & Co., Boston, are preparing plans for a 4-story, 75 x 85-foot factory addition for the Curtis & Marble Machine Co.

AUBURN, R. I.—The Universal Winding Co. has started work on two additions to its foundry. One addition is to be 159 x 200 feet and the other 50 x 159 feet.

PROVIDENCE, R. I.—Dutee W. Flint has let the contract for a 1-story, 100 x 147-foot addition to a storage building.

PROVIDENCE, R. I.—The United Wire & Supply Co. has started work on a plant addition, 2-stories, 40 x 250 feet, to cost $100,000.

WESTERLY, R. I.—The Westerly Brass Co. recently was incorporated and has taken over the Smith Granite Co.'s building, to which an addition will be built.

WOONSOCKET, R. I.—The Woonsocket Wagon Mfg. Co. has let the contract for a 2-story, 75 x 200-foot, with a 3-story, 60 x 60-foot ell, factory addition to cost $25,000.

BERLIN, CONN.—For the purpose of manufacturing metal goods, the Mosel Mfg. Co. has purchased the plant of the Hartford Burial Case Co.

BRIDGEPORT, CONN.—The Coulter & McKenzie Machine Co. contemplates a 1-story machine shop.

BRIDGEPORT, CONN.—The Hawie Mfg. Co. contemplates a plant addition, 1-story, 40 x 160 feet.

BRIDGEPORT, CONN.—The Locomobile Co. of America has let a contract for a 2-story, 50 x 80-foot plant addition to cost $25,000.

BRIDGEPORT, CONN.—The Bridgeport Screw Co. contemplates a wire mill.

BRIDGEPORT, CONN.—The Miller Bros. Cutlery Co. will erect an addition.

BRIDGEPORT, CONN.—The Singer Mfg. Co. plans a forge shop, to cost $40,000.

BRIDGEPORT, CONN.—The Bridgeport Motor Truck Co. has been incorporated to make motor vehicles, parts, accessories, etc., with $500,000 capital by W. J. Buckley, P. S. Chapman and S. F. Primrose.

BRIDGEPORT, CONN.—The United Illuminating Co. will erect a power plant, with an initial development of 75,000 horsepower.

BRIDGEPORT, CONN.—Plans are being made for a 3-story, 40 x 142-foot factory for the American Specialty Co., metal stampings.

BRIDGEPORT, CONN.—The Crane Co. has awarded Stone & Webster a contract to erect a combined manufacturing and foundry building, here, to be 3-stories, 80 x 500 feet.

BRIDGEPORT, CONN.—The Connecticut Auto Accessory Co. has been incorporated to make automobile accessories with $200 000 capital by J. H. Solen, H. F. Blackwell and Jacob Massoth.

BRISTOL, CONN.—The G. H. Sessions & Sons Co., manufacturers of trunk hardware, have started work on two large additions.

HARTFORD, CONN.—The Goodyear Tire & Rubber Co. will build a $300,000 building.

HARTFORD, CONN.—The Ainslee Machine Co. has been incorporated for $100,000 to manufacture machines and firearms.

HARTFORD, CONN.—The Lucia Mfg. Co., Inc., has been incorporated with $50,000 capital to manufacture automobile accessories.

HARTFORD, CONN.—The Hartford Special Machinery Co. contemplates a plant, one story, 60 x 200 feet, to cost $30,000.

HARTFORD, CONN.—Approximately 20,000 square feet of floor space will be added to the plant of the Whitlock Coil Pipe Co., at an estimated cost of $50,000.

HARTFORD, CONN.—The Fenn Mfg. Co. has been incorporated with $100,000 capital by W. L. Fenn, W. A. Fenn and S. L. Livingstone, and will manufacture machinery.

HARTFORD, CONN.—The Colt Patent Firearms Mfg. Co., through its president, denies the recent statement that the company's plant in Meriden, Conn., has been sold to the General Motors Co.

HARTFORD, CONN.—The Reising Arms Co. has been incorporatd to manufacture firearms. The authorized capital is $100,000. The incorporators are William Ainslie, John S. Woodard and Alan K. Smith.

KENSINGTON, CONN.—The Mosel Mfg. Co. has been incorporated with $1,000,000 capital to manufacture mill supplies, by H. H. Wessel, F. J. Moran and B. F. Gaffney.

MERIDEN, CONN.—The Meriden Electric Light Co. will build a plant.

MIDDLETOWN, CONN.—The Elder Mfg. Co. has been incorporated with $25,000 capital to make gold and silver articles, by Charles S. Elder, Alfred M. Butts and John L. Ullberg. The company has leased the old plant of the Wilcox Lock Co.

NAUGATUCK, CONN.—Plans are being prepared for a 4-story, 40 x 80-foot extension to the Naugatuck Electric Co.

NEW BRITAIN, CONN.—The New Britain Machine Co. will build an addition to its plant, 32 x 320 feet, to cost $40,000.

NEW HAVEN CONN.—The Arnold Electric Tool Co. is reported planning to increase its capital to finance plant extensions.

NEW HAVEN, CONN.—The William Scholl Horn Co., manufacturers of hardware and cutlery, will build a factory addition, 4-stories, 41 x 131 feet.

NEW HAVEN, CONN.—The Wireless Bell Mfg. Co. has been incorporated with $10,000 capital, by Maurice Serachausky, Louis M. Rudman and Benjamin F. Goldman.

WATERBURY, CONN.—A. C. Campbell & Co. have let the contract for a 4-story, 34 x 100-foot and a 2-story, 34 x 140-foot with a 50 x 60-foot ell, plant.

WESTBROOK, CONN.—The Holbrook Co. has been incorporated to do general contracting, engineering, etc., with $50,000 capital, by J. G. Holbrook, J. A. Holbrook, Chapman Holbrook and C. M. Brainard.

North Atlantic States

BATH, N. Y.—An addition to the municipal electric light and power plant here will be built at once.

BINGHAMTON, N. Y.—The I. G. Jones Supply Corp., engines, boilers and electrical machinery, has been incorporated with $75,000 capital, by I. G. and J. P. Jones and G. H. Winkler.

BINGHAMTON, N. Y.—Wilcox Bros., Inc., have been incorporated to manufacture engines, concrete mixers, etc., with $50,000 capital, by W. H. Wilcox, H. R. Wilcox, B. W. Wilcox and others.

BROOKLYN, N. Y.—The M. Vierengel Machine Co. has been incorporated with $10,000 capital, by M. F. and H. Vierengel, 1050 Greene avenue.

BROOKLYN, N. Y.—The Knight Can Co. has been incorporated with $5000 active capital, by C. E. Knight, A. R. Oelker and C. F. Bailey, 2226 Loring place.

BROOKLYN, N. Y.—The S. Frank Woodworking Co. recently was incorporated with $10,000 capital, by P. and M. M. and S. Frank, 133 Bainbridge street.

BROOKLYN, N. Y.—The Chimbo Wheel Corp. has been incorporated with $50,000 capital, by S. Astarsi, P. Ugaldea and C. Munroe, 130 Glen street.

BROOKLYN, N. Y.—The S. P. Ellsworth Mfg. Co., machinery, recently was incorporated with $15,000 capital, by M. W. and P. G. Morehouse and W. K. Bedell, 479 Greene avenue.

BROOKLYN, N. Y.—The Quarnstrom Automatic Reverse Machine & Mfg. Co. has been incorporated with $100,000 capital, by A. Quarnstrom, G. Boquist and H. Peterson, 11 East Fourth street.

BUFFALO.—The Buffalo Steel Car Co. plans a plant.

BUFFALO.—The American Radiator Co. will build an addition.

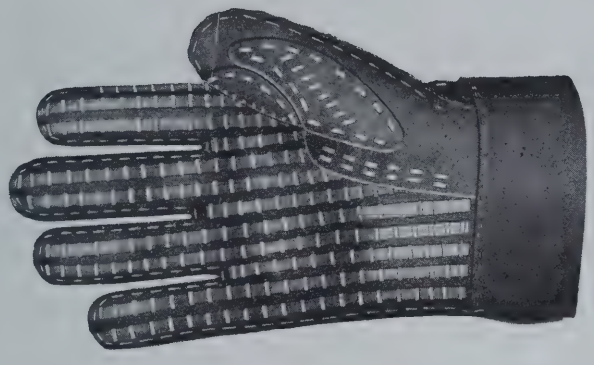
BUFFALO.—The Guilford Mfg. Co. will build a boiler room.

BUFFALO.—The Stewart Motor Machinery Co. will build a $10,000 addition.

BUFFALO.—W. A. Case & Sons Mfg. Co. will remodel property on Second street for a warehouse.

BUFFALO.—The Buffalo Porcelain Enamel Co. has let the contract for a $25,000 plant. Frederick H. Williams is manager.

BUFFALO.—The Auto Products Mfg. Co., 128 Erie street, contemplates a plant, one story, 60 x 100 feet, to cost $18,000.



BUFFALO.—The Elliott Machine Co. recently was incorporated with $15,000 capital, by J. E. Cufkowski, W. Bush and D. Wilkinson.

BUFFALO.—The Buffalo Knife Co. has been incorporated with $25,000 capital, by H. A. Schroedel, E. S. Pease and W. R. Daniels.

EAST ORANGE, N. J.—The Motor Starter & Pump Co. recently was incorporated with $200,000 capital to manufacture starters, pumps, compressors, etc.

IRVINGTON, N. Y.—The Burnham Boiler Corp.

When the Job Drags

No. 604 Short Glove

A most serviceable glove for use where gauntlet gloves are not necessary. Reinforced with leather strips and steel ribbons. Steel sewed seams.

Price—per dozen pairs, $16.50

No. 678 Reversible Mitten

A short leather mitten, steel sewed, that can be worn on either hand. Two mittens for the price of one.

Price—per dozen pairs $9.00

It may not be the fault of the organization and frequently you can trace it down to some simple thing like a sore hand that handles the castings.

A sore hand gets good pay but it can't do a good day's work.

The meanest job of sand blasting, handling castings, scrap, etc., is made more comfortable and safe when Steel-Grip gloves are used.

Your workmen have to wear some kind of hand protection and the most economical kind is that which wears the longest and which gives most protection and comfort.

Other gloves cost more, service and comfort considered, than Steel-Grip.

Make your comparison by ordering a trial dozen today.

has been incorporated with $1,000,000 capital, by H. L. Vanderbilt, C. H. Seifert and O. F. P. Korb, 1824 Wallace avenue.

NEW YORK.—Plans are reported contemplated by the Cunard Steamship Co. for a $20,000,000 terminal on the Jersey side of the Hudson river.

NEW YORK.—The Thompson Vehicle Spring Co. has been incorporated with $100,000 capital, by C. D. Ireland, W. H. Duval and J. S. Epstein, 2 Rector street.

NEW YORK.—The Hardened Copper Cutlery, Inc., has been incorporated with $175,000 capital, by R. S. Baker, F. H. Buttehorn and E. S. Hawley, 50 Vanderbilt avenue.

NEW YORK.—The Cyclops Engineering Corp., metal specialties, tools, etc., has been incorporated with $15,000 capital, by W. J. Cook, C. A. Brooks and F. P. Ward, 80 Pine street.

NEW YORK.—The W. M. Levett Corp., metals, tools and implements, has been incorporated with $105,000 capital, by W. M. Levett, J. W. Collins and L. E. Valcourt, 441 East Twenty-third street.

NEW YORK.—The V. & N. Lantern Co., Inc., has been incorporated with $50,000 capital to manufacture railroad lanterns, etc., by F. W. Winton, Weehawken, N. J.; J. Nicchbai, 256 Broadway, New York, and J. Manning, 259 East Fourth street, Brooklyn, N. Y.

NEW YORK.—The George A. Fuller Co., this city, has announced the purchase of a shipbuilding plant in Wilmington, N. C., which was built under an agency contract with the Emergency Fleet Corp. The Fuller company, however, will not assume control until after the government contract has been completed. The yard was built at an estimated cost of $3,500,000, and has been operated through the Carolina Shipbuilding Corp.

OGDENSBURG, N. Y.—The Hudson Brass Works has plans for a plant, 2-stories, 30 x 100 feet.

PATERSON, N. J.—The General Machine Co. has been incorporated with $25,000 capital, by I. B. Hebenstreit, Lillian Hebenstreit and Hugh Townsley.

PHILADELPHIA.—Approximately $1,000,000 will be expended by the Gomery, Schwartz Motor Car Co. The structure will be 137 x 446 feet.

PHILADELPHIA.—A general contract for a $45,000 factory building for the Franklin Process Co. has been awarded to the J. H. Bishop Co., Providence, R. I. The structure will be 75 x 103 feet.

ROCHESTER, N. Y.—The Bodine-Fogg, Inc., wood and iron finishing products, has been incorporated with $50,000 capital, by G. W. Bodine, D. B. Fogg and C. S. Bennett.

SEDGEWICK, N. Y.—The Sedgewick Machine Works has plans for a plant addition, 2-stories, 40 x 100 feet.

SYRACUSE, N. Y.—The Franklin Die Casting Corp. recently was incorporated with $25,000 active capital, by A. B. Pailca, H. C. Skinner and H. L. Franklin.

WHITEHALL, N. Y.—The Hooper Graphite Co. recently was incorporated with $250,000 capital, by F. C. Hooper, W. H. Hill and F. B. Richards, Glens Falls, N. Y.

BUTLER, PA.—The Pittsburgh-Hickson Bedstead Co., East Butler, has sold its plant to the Corona Cord Tire Co., of this city, which is making extensive improvements. T. W. Phillips Jr., is president of the Corona company.

CONNELLSVILLE, PA.—The Yough Electric Co. is having plans prepared for a power plant here.

ERIE, PA.—The Lakeside Forge Co. plans a forge shop addition, 1-story, 55 x 75 feet.

ERIE, PA.—The Erie Malleable Iron Works has a permit to erect a 4-story office building, 45 x 67 feet, to cost $45,000.

FRANKLIN, PA.—The foundry owned by Frank D. Lane, a building 40 x 50 feet, recently was damaged by fire. It will be rebuilt.

PITTSBURGH.—The Jones & Laughlin Steel Co. will build a pumping station.

PITTSBURGH.—The Star Bronze Foundry & Machine Co. has let the contract for a machine shop.

PHILADELPHIA.—A. F. Knipe has awarded the general contract for the erection of a crane runway and storage building to W. E. Hall. Approximately $22,700 will be expended.

READING, PA.—An increase in capital of $1,350,000, to cover costs of new improvements, principally additional equipment and power transmission lines, has been announced by the Metropolitan Edison Co.

SHARON, PA.—The National Malleable Castings Co. will build an addition 100 x 325 feet here.

YORK, PA.—The York Metal & Alloys Co. will build an addition.

EAST ORANGE, N. J.—The Motor Starter & Air Pump Co. has been incorporated with $200,000 capital, by Gordon E. Picking and M. Y. McKenzie.

IRVINGTON, N. J.—The Irvington Plating & Tool Co. recently was incorporated with $50,000 capital, by J. L. McKenna, Newark, N. J., Edward Roesken, Belleville, N. J., and J. L. Rafferty.

NEWARK, N. J.—Plans have been completed by the L. E. Waterman Co. for the first unit of a plant to cost more than $1,000,000. The unit will be eight stories. Each of the side wings will measure 80 x 240 feet, and will be connected by a building 60 x 240 feet.

TRENTON, N. J.—With a view to tripling its output, the Mercer Motors Co. plans to expend approximately $650,000.

BALTIMORE.—The American Spike Co. according to a report, plans a plant.

Central States Activity

BARTON, WIS.—The Stevenson Mfg. Co. expects to occupy its new plant about Feb. 1 and has placed orders for drill presses, lathes, forges and other equipment for manufacturing steel barn equipment.

BRILLION, WIS.—The village board of trustees will have plans made for a municipal water works, fire protection and sewerage system to be constructed during the coming year at an approximate cost of $75,000.

CLAYTON, WIS.—Articles of incorporation have been filed by the Joel Electric Co., Clayton, Polk county. The capital stock is $20,000 and the purpose to build and operate an electric light and power plant. Menus Johnson and F. J. Anderson are the promoters.

COLUMBUS, WIS.—The Standard Oil Co. has purchased a site, 48 x 150 feet, and will erect a warehouse.

FOND DU LAC, WIS.—The Northern Casket Co., maker of wood and metal coffins, will take bids for a 3-story factory addition, 100 x 100 feet.

FOX LAKE, WIS.—The Six Wheel Truck Co. has been incorporated with a capital of $60,000 to manufacture a combination motor truck and trailer. F. N. Pettegrew, H. M. Howard and W. C. O'Connell are the organizers.

GREEN BAY, WIS.—The Oneida Motor Truck Co. is laying foundations for the first of a series of shop extensions.

HARTFORD, WIS.—The Hartford Foundry Co. has been incorporated with $10,000 capital, by I. L. Bonniwell, R. LaPoint and others.

IOLA, WIS.—J. A. Rosholt will erect a 1-story garage and general machine repair works, 56 x 120 feet.

JANESVILLE, WIS.—The Samson Tractor Co. will build two foundries, 322 x 500 feet. F. D. Chase, Inc., 645 North Michigan avenue, Chicago, is engineer.

KENOSHA, WIS.—The Frost Mfg. Co., manufacturer of brass goods and general plumbing and steam heating supplies, has awarded contracts for two additions, each 66 x 76 feet, to its brass foundry and machine shop. New equipment is being purchased.

LA CROSSE, WIS.—The Iron Products Corp. has been chartered with $100,000 capital, by C. R. Pieper, O. M. Schlabach, Harry Dahl and A. J. Boberge. The company has purchased a site, on which it plans a foundry, 100 x 150 feet.

MELLEN, WIS.—A general machine shop and repair works has been opened here by John Lundwuist.

MILWAUKEE.—The Pelton Steel Co. is erecting an addition, 30 x 100 feet, to its electric steel foundry.

MILWAUKEE, WIS.—The Milwaukee Reliance Boiler Works, 1102 Thirty-second street, will build a 1-story plant, 70 x 180 feet. A. D. Koch, Wells building, is architect.

MILWAUKEE.—The Manufacturers Box Co., 130 Reservoir avenue, has let the contract for a 1-story factory, 100 x 300 feet. The company plans to spend $125,000 for the building and machinery. Frank L. Weyenberg is president.

MILWAUKEE.—The Manufacturers Foundry Co., Fifteenth and Oklahoma avenues, contemplates important enlargement to its gray iron and malleable shop during the coming year.

MILWAUKEE.—The Cadillac Motor Car Co., Detroit, has awarded the general contract for a branch assembling plant here, three stories, 150 x 250 feet, to cost $250,000.

MILWAUKEE.—The Seaman Body Corp., 480 Virginia street, has awarded contracts for a plant, to consist of four units, each 180 x 420 feet, and cost about $1,500,000.

MILWAUKEE.—The Northwestern Bridge & Iron Co. has the contract for building a 160-foot craneway extension and general alterations at the main works of the Nash Motor Co.

MILWAUKEE.—The Sterling Tool & Mfg. Co., capitalized at $25,000, has been chartered to manufacture tools and machinery by Harry R. Kuntz, Louis Wiener and E. G. Patek.

MILWAUKEE, WIS.—The Bankers' Automatic Alarm Corp., capitalized at $500,000, has been chartered to manufacture alarm systems by J. A. Baer, F. J. Jannings and L. B. Miller.

MILWAUKEE.—Klug & Smith, consulting engineers, Mack block, have the contract to construct a $75,000 car barn addition, 80 x 200 feet, for the Milwaukee Electric Railway & Light Co.

MILWAUKEE.—Articles of incorporation have been filed by the Precision Machine Co. The capital stock is $6000 and the objects to manufacture and deal in machinery, tools, fixtures and other metalworking equipment. The incorporators are Charles F. Hussey, August J. Raddatz and A. G. Schwefel, attorney.

OCONOMOWOC, WIS.—H. Kirk White, secretary, board of education, is taking bids until Jan. 15 for a $200,000 high school, which will include a complete manual training department.

OSHKOSH, WIS.—A 1-story machine shop addition, 30 x 240 feet, will be erected for the Wisconsin Parts Co. W. E. Rockwell is general manager.

RACINE, WIS.—The Harvey Spring & Forging Co. is having plans prepared for a manufacturing addition, part two stories, 100 x 200 feet.

SHEBOYGAN, WIS.—The Globe Foundry Co. will build a gray iron foundry 100 x 128 feet, a pattern shop and core building 70 x 150 feet, costing $100,000. G. F. Honold is president.

SHEBOYGAN, WIS.—Verhulst Bros. have the contract to build a $75,000 gray iron foundry, 100 x 128 feet, and an auxiliary building, 70 x 150 feet, for the Globe Metal Products Co.

TOMAH, WIS.—The Tomah Electric Co. intends to engage an engineer to outline plans for a new combination steam and water power light plant. Louis W. Barnes is manager.

WEST ALLIS, WIS.—The Avery Co., Peoria, Ill.,

is spending about $65,000 in erecting an addition to its engine works here. James Pinson is general manager.

WESTFIELD, WIS.—Architects Parkinson & Dockendorff, La Crosse, Wis., are preparing plans for a high school building estimated to cost $100,000. A manual training department will be included.

DETROIT.—The Burroughs Adding Machine Co. contemplates a 2-story plant.

DETROIT.—The Michigan Electric Plating Co., 110 South Antoine street, has plans for a plant, 1-story, 25 x 125 feet.

DETROIT.—The Monarch Foundry Co., 907 Greenwood avenue, will build a 1-story foundry 100 x 200 feet to cost $100,000.

CHICAGO.—The International Harvester Co. has plans for an extension, to cost $15,000.

CHICAGO.—The Pullman Co. has a permit to erect a plant extension at an estimated cost of $150,000.

CHICAGO.—The Advance Machine Co., 4645 Ravenswood avenue, has plans for a 2-story plant, to cost $10,000.

CHICAGO.—The Channel Chemical Co., 1419 Carroll avenue, will build a 4-story plant 150 x 300 feet, costing $400,000.

CHICAGO.—The Great Western Laundry Co., 2319 Madison avenue, contemplates a laundry and power house, to cost $200,000.

CHICAGO.—The Economy Fuse Mfg. Co., 328 West Kinzie street, is finishing plans for a plant, 1-story 130 x 264 feet, to cost $135,000.

CHICAGO.—The Continental Can Co., T. G. Cornwell president, 111 West Washington street, will build a 3-story plant, 114 x 125 feet, costing $200,000. S. Scott Joy, 2001 West 39th street, is architect.

HAVANA, ILL.—The E. J. List Mfg. Co., recently chartered with $35,000 capitalization, is building an addition and is seeking equipment for the manufacture of clutches and other devices.

ROCKFORD, ILL.—The Rockford Milling Machine Co. plans a plant addition, 1-story, 53 x 65 feet.

ANDERSON, IND.—The plant of the Barber Bed Spring Co. recently was damaged by fire. The loss has been estimated at $75,000.

EAST CHICAGO, IND.—The Lever Coil Spring Co., capitalized at $200,000, has been chartered by Richard T. Hamilton, Charles S. Rhoades and Clarence C. Smith.

INDIANAPOLIS.—The L. V. Zelander Mfg. Co. has been incorporated with $25,000 capital to manufacture electrical supplies. The directors are L. V. Zelander, R. A. Coombs and Elmer Kidwell.

INDIANAPOLIS.—The Multi-Aircraft & Motors Co., a Delaware corporation, capitalized at $3,000,000, has established headquarters here at 112 East Market street, and will manufacture airplanes, as soon as a plant is completed.

KOKOMO, IND.—The Instant Starter Co. recently was incorporated with $25,000 capital, by Raymond W. Nichols, M. W. Haynes and Charles G. Kerlin.

LOGANSPORT, IND.—The Logansport Body Works, capitalized at $200,000, has been chartered to manufacture automobile bodies by S. O. Coke, Edwin Ash and William O. Murdock.

RICHMOND, IND.—The Jenkins Vulcan Spring Co., T. B. Jenkins president, will build a one and 2-story plant, 75 x 400 feet. John W. Mueller, Leeds building, is architect.

TERRE HAUTE, IND.—The Standard Wheel Co. has been incorporated with $600,000 capital, by Carl D. Fischer, Emil J. Fischer and W. C. Clark.

AKRON, O.—The Paragon Electrical Mfg. Co. has been incorporated with $10,000 capital, by M. Moskovitz, S. Kail and others.

AKRON, O.—The Wildey Machine & Mfg. Co. recently was incorporated with $50,000 capital, by Carl A. Wildey, J. R. Hoffman and others.

CANTON, O.—A building at the plant of the United Alloy Steel Corp. recently was damaged by fire.

CANTON, O.—The State Iron & Metals Co. recently was incorporated with $60,000 capital, by Louis H. Kayen, David Levine and others.

CANTON, O.—The Federal Foundry Co. recently was incorporated with $25,000 capital, by Clarence M. Converse, I. A. Converse, Frank A. Peter, A. M. Peter and Russell J. Burt.

CINCINNATI.—The Kind Machine Tool Co. has awarded a contract for a plant addition, to cost $50,000.

CINCINNATI.—The Langhaar Ball Bearing Co. has been incorporated with $100,000 capital, by R. E. Simonds Jr., M. J. McCauley and others.

CLEVELAND.—The Cuyahoga Spring Co. is reported planning a building at an estimated cost of $57,000.

CLEVELAND.—The Bender Body Co. is said to be planning a foundry, 133 x 350 feet, to cost $50,000.

CLEVELAND.—The Economy Appliance Co. has been incorporated with $30,000 capital, by Samuel I. Rice, Olin J. Fulton and others.

CLEVELAND.—The Morse-Rogers Steel Co. recently was incorporated with $100,000 capital, by F. H. Morse, H. V. Morse, 1881 East Eighty-seventh street, and others.

CLEVELAND.—The Eaton Axle Co. has been incorporated with $3,000,000 capital, by J. O. Eaton, S. H. Tolles and others, and will build a plant for the manufacture of axles, etc.

COLUMBUS, O.—The Austin Western Road Machinery Co., Chicago, has leased a building here which will be used for assembling purposes. The company is said to have also taken an option on a 10-acre tract, on which it plans to erect a plant in the future.

CUYAHOGA FALLS, O.—The Bridgewater Machine Co., Akron, O., is said to have purchased a tract here, on which it contemplates a plant.

ELYRIA, O.—The Steel Products Co. is expected to start work shortly on a plant.

HAMILTON, O.—The plant of the Niles Tool Works recently was damaged by fire.

PAINESVILLE, O.—The Lake Erie Foundry Co. has been incorporated with $50,000 capital, by H. K. Wade, L. H. De Forest, M. C. Price, Fred M. Wyss and C. A. Newport.

TOLEDO, O.—The Fast Feed Drill & Tool Corp. is reported planning extensive plant additions.

TOLEDO, O.—The plant of the Milburn Wagon Co. recently was damaged by fire. The loss has been estimated at $900,000. The damaged part of the plant includes the finishing and assembling departments and the company's offices.

ZANESVILLE, O.—The Federal Radiator Co. recently was incorporated with $525,000 capital.

GERMANTOWN, KY.—The Mason-Bracken Electric Co. has been organized by H. L. Corlis and others, and will operate an electric light and power plant.

CHARLESTON, W. VA.—The American Armature Engineering Co. has been incorporated with $25,000 capital, by G. E. Stupalsky, A. A. Grant and A. D. Knight.

SISTERVILLE, W. VA.—The Sisterville Tank & Boiler Works plans a building to be devoted to the manufacture of steel derricks, etc.

TUCKER, W. VA.—The Dawson-Connellsville Collieries Co. will spend $75,000 for improvements to its mine and equipment here.

Throughout the West

DULUTH.—P. G. Phillips, commissioner of public utilities, is having plans prepared for a new building for the waterworks and electric light plants.

MINNEAPOLIS.—The Minneapolis Heat Regulator Co. contemplates a plant addition, two stories, 61 x 127 feet, to cost $100,000.

BRITT, IOWA.—The Hawkeye Woven Wire Fence Co. has completed its organization and is now preparing plans for its plant. Officers of the company are: President, J. Q. A. McClurg; vice president, M. G. O'Brien and secretary, V. W. Erwin.

MASON CITY, IOWA.—The Mason City Foundry & Machine Co., capitalized at $30,000, has been chartered by L. G. Dreyer and R. E. Wilcox.

JOPLIN, MO.—Waterworks improvements costing $1,500,000 are being planned including pumping station, reservoir, settling tanks and mains.

KANSAS CITY, MO.—The Kansas City Railways Co. plans a power plant, to cost $27,000.

ST. LOUIS.—The Schlueter Bros. Mfg. Co., tinware, plans a 2-story building.

ST. LOUIS.—The Standard Stamping Co. contemplates a machine shop, 1-story, 24 x 41 feet.

ST. LOUIS.—The Wilson Stove Co. is having plans drawn for a plant, two stories, 100 x 120 feet.

ST. LOUIS.—The Emerson Electric Mfg. Co. is selling $1,000,000 worth of preferred stock, the proceeds to be used for a factory building.

ST. LOUIS.—The Whitney Milling Machine Co., Hugh Whitney, Webster Groves, Mo., president, will build a plant for the manufacture of tools at a cost of $100,000.

ST. LOUIS.—The Liberty Auto Lock Co. has been organized with offices at 2209 Pine street, by E. W. Link, John L. Malone and others, to engage in the manufacture of locks. The company plans a plant to include a foundry.

FT. SMITH, ARK.—The Ft. Smith Light & Traction Co. plans a plant addition to cost $250,000.

LITTLE ROCK, ARK.—The Fones Bros. Hardware Co. plans a plant, five stories, 130 x 200 feet, to cost $300,000.

TEXARKANA, ARK.—The Chandler Welding & Machine Co., capitalized at $25,000, has been chartered to enlarge and re-equip the small plant it now operates. M. B. Chandler is president.

DALLAS, TEX.—Sutton, Steele & Sutton, Inc., manufacturer of mining and oil well machinery, will build an addition costing about $200,000, including a structure 40 x 100 feet, a 50 x 80 foot building and smaller units.

EASTLAND, TEX.—The Howard Tools Works has been incorporated with $50,000 capital, by D. M. Howard, P. S. Wolfe and H. L. Durlin.

FT. WORTH, TEX.—The Boicourt Co., 1001 Railroad avenue, is installing an iron foundry. J. L. Boicourt controls the company.

FT. WORTH, TEX.—The Ft. Worth Drilling Tool Co., capitalized at $400,000, recently chartered to manufacture tools and oil well equipment, has started the first unit which includes a machine shop 90 x 120 feet, a forge shop, 50 x 122 feet, and other structures.

McGREGOR, TEX.—The Texa Implement & Mfg. Co., capitalized at $200,000, has been chartered to manufacture implements and tools by G. H. Caulfield, M. A. Jones and J. F. Cavitt.

RANGER, TEX.—The Crescent Sheet Metal Co. has been incorporated with $10,000 capital, by F. E. Skinner, W. E. Skinner and A. M. Fitzgerald.

CLEVELAND, OKLA.—The city of Cleveland has voted $40,000 in bonds for a gas plant and mains. D. B. Heller is clerk.

TAHLEQUAH, OKLA.—This city will install an

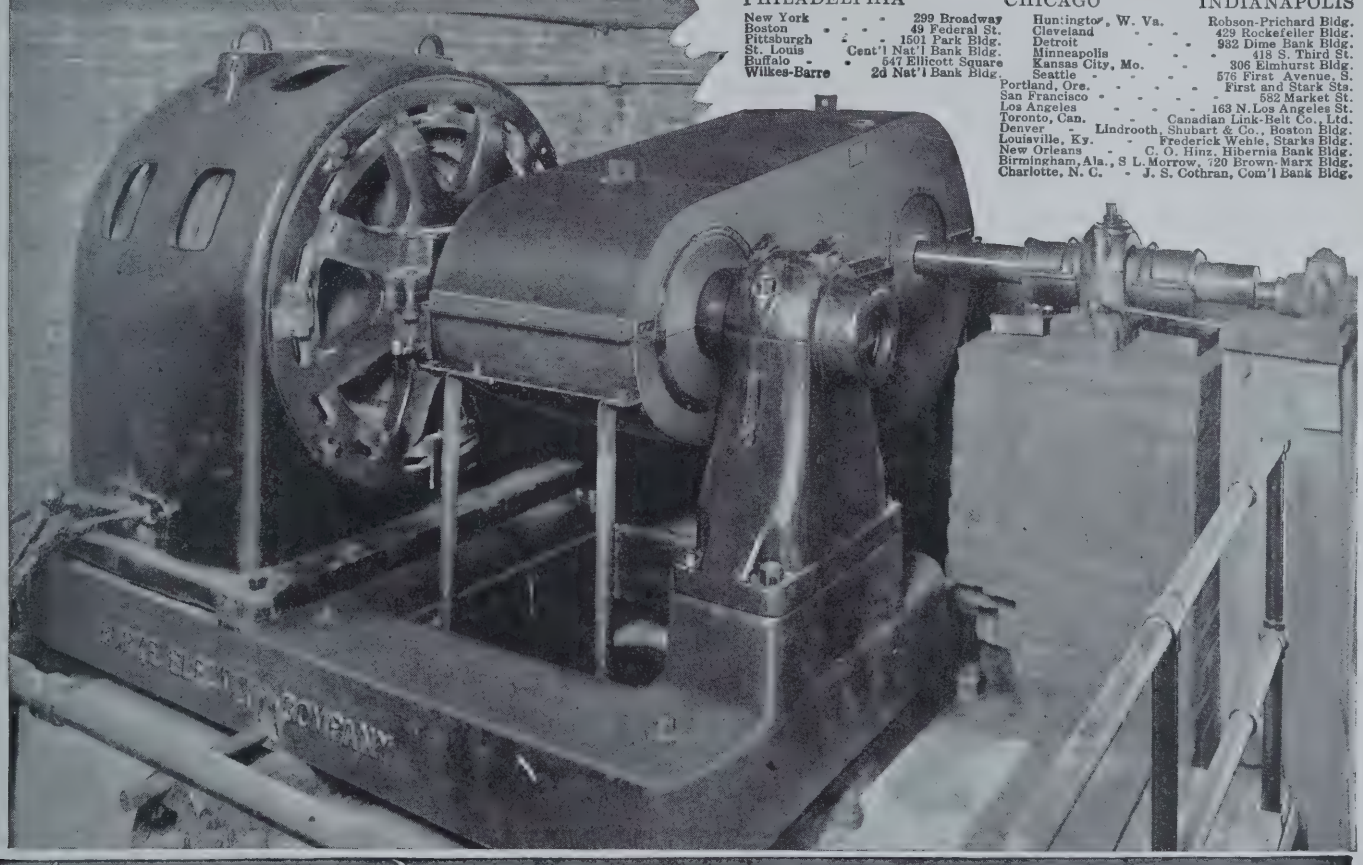
Why Link-Belt Silent Chain is the Correct Drive

COULD any other form of power transmission operate with efficiency on the short centers shown in these illustrations? This drive like hundreds of others, is operating almost continuously—it has never been shut down for repairs. The plant in which it is installed depends upon its constant daily performance.



Note the drive is enclosed in the patented Link-Belt oil-tight, dust-proof casing. Lubrication automatically reaches the chain. Safety to employees is assured. And the drive is, like all Link-Belt Silent Chain Drives, 98.2% efficient.

Let us show you where you can use an efficient Link-Belt Silent Chain Drive in your plant.

electric light and power plant at an estimated cost of $100,000.

WYNONA, OKLA.—The Wynona Light, Power & Water Co. has been incorporated with $50,000 capital, by Frank Watson, William Watson and F. M. Overless.

SCOTLAND, S. DAK.—The L. & K. Mfg. Co. has been incorporated to manufacture metal fence posts with $50,000 capital, by L. L. Spencer, J. R. Wilson and H. H. Kesler.

HELENA, MONT.—The Basin Power & Smelting Co. has been incorporated with $8,000,000 capital.

IDAHO FALLS, IDAHO.—A special election will be held soon on issuing $500,000 in bonds for a filtration plant.

Business in Canada

NOKOMIS, SASK.—The council is making arrangements and is receiving quotations on equipment for an electric lighting plant to cost $21,000.

BROWNSBURG, QUE.—The Dominion Cartridge Co., 120 St. James street, Montreal, has let the general contract for a factory here to cost $50,000.

CHICOUTIMI, QUE.—Tremblay & Dufour, Ltd., have been incorporated to manufacture tools, etc., with $50,000 capital, by Ernest Roy, Romeo Langlais, Armand Lavergne and others.

HULL, QUE.—The Eastern Canada Motor Truck Co. has let the general contract for a plant here.

LACHINE, QUE.—The Dominion Bridge Co. is having plans prepared for a foundry here. This plant will be constructed and used in connection with the company's new undertaking, the manufacture of paper mill machinery and turbo machinery.

MONTREAL, QUE.—The McClary Mfg. Co., manufacturer of stoves and furnaces, is having plans prepared for a 4-story extension.

MONTREAL, QUE.—The United Shoe Machinery Co., 1010 Bennett avenue, has awarded contracts in connection with a manufacturing building to cost $44,000.

MONTREAL, QUE.—The Dominion Engineering & Machinery Co., Ltd., has been incorporated to manufacture machinery, with $3,000,000 capital, by L. H. Ballantyne, F. G. Bush and George R. Drennan.

MONTREAL, QUE.—The Scientific Experimenter, Ltd., has been incorporated to manufacture telegraph and telephone apparatus, with $100,000 capital, by Colville Sinclair, Shirley G. Dixon and Ralph E. Allan.

MONTREAL, QUE.—The Canadian Nathan, Ltd., has been incorporated to manufacture machinery, etc., with $100,000 capital, by Henry A. Burbidge, John R. Marshall, Arthur B. Turner and others, all of Hamilton, Ont.

MONTREAL, QUE.—Simmons, Ltd., has been incorporated to manufacture iron, steel, and brass products, beds, springs, etc., with $10,000,000 capital, by William S. Morlock, 85 Bay street; Sydney E. Wedd, 162 Jameson avenue; Roy B. Whitehead and others.

BRIDGEBURG, ONT.—The Reliance Fuse Co., of Canada, Ltd., is making arrangements for a plant here. A. W. Plumley, Mutual Life building, Buffalo, is interested.

CHATHAM, ONT.—The Chatham public utilities commission plans extension of local hyroelectric system to cost $90,000.

FORT MATCHEWAN, ONT.—A British syndicate has engaged Sutcliffe & Neelands, engineers, New Liskeard, Ont., to select a site and prepare plans for a power plant to cost $250,000.

GODERICH, ONT.—The Dominion Road Machinery Co. will build a plant addition to cost $15,000.

HAMILTON, ONT.—The Tallman Brass Co. has purchased 14 acres on Burlington street, as a site for plant extensions.

HAMILTON, ONT.—The MacPherson Wire Co., Ltd., has been incorporated by John A. MacPherson, George Carley, Henry Dunham and others, with $400,000 capital, to take over the plant and business now carried on under the name of the MacPherson Mfg. Co., Ltd., and to manufacture wire, tools, metal products, etc.

HAMILTON, ONT.—The B. Greening Wire Co., 55 Queen street north, has let the general contract for a manufacturing plant.

NIAGARA FALLS, ONT.—The Bissel Carpet Sweeper Co., Ltd., has been granted a license to carry on business in the province with $100,000 capital and has appointed Percy D. Weston its representative.

OTTAWA, ONT.—Fred Menagh, 101 Pintey street, has started work on a foundry to cost $60,000.

PALMERSTON, ONT.—The I. X. L. Mfg. Co., Ltd., has been incorporated to manufacture woodenware, metalware, dynamos, electrical equipment, machinery, etc., with $40,000 capital, by John Youngson, Charles Forrest, Robert G. Scott and others.

SARNIA, ONT.—The plant of the Covered Metal Corp. recently was damaged by fire. The loss has been estimated at $250,000.

ST. CATHARINES, ONT.—The Gear Products of Canada, Ltd., has been incorporated by George H. Allington and Harvey T. Harrison, William G. Tingle, 12 Laurier avenue, Toronto, Ont., and others, with $250,000 capital, to manufacture gears, cutters, axles, tools, etc.

TORONTO, ONT.—Soren Bros., 549 King street west, manufacturers of sheet metal products, etc., will call for bids shortly for a plant to cost $200,000.

TORONTO, ONT.—The Western Motors, Ltd., has been incorporated by Alfred W. Briggs, room 50, 33 Richmond street, Roy W. Lent and others, with $40,000 capital, to manufacture automobiles, etc.

TORONTO, ONT.—The Multiple Electric Products Co., Inc., has been granted a license to carry on business in the province in the manufacture of electrical machinery, appliances, etc., with $5000 capital and has appointed Albert E. Fleming, 10 Britannia avenue, its representative.

Business Changes Recently Announced

THE Worcester Machine Screw Co., Worcester, Mass., has dismantled its plant and is shipping the machinery to the Hartford, Conn., plant. Labor trouble is said to have hastened the departure of the company from Worcester. The company manufactured screws and specialties. A part of the building will be used now to carry a stock of parts for Worcester and the county trade.

* * *

The southern sales office of the Bucyrus Co., South Milwaukee, Wis., has been removed from New Orleans, La., to 212 Jefferson County bank building, Birmingham, Ala.

* * *

The Consolidated Steel Corp., 165 Broadway, New York, has opened a sales office at 1419-20 L. C. Smith building, Seattle, with Arthur H. Jones in charge.

* * *

The Western Structural & Machine Works, Peoria, Ill., has taken over the plant and business of the J. C. Armstrong Machine Co.

* * *

Avery & Saul, South Boston, Mass., sheet metals, have removed their headquarters to 297-299 Dorchester avenue, South Boston.

* * *

The Lebanon Machine Co., Lebanon, N. H., has disposed of its auger bit department to the Winchester Repeating Arms Co., New Haven, Conn., and it will be removed to that city. The company retains its machine shop and foundry.

* * *

A. Burlingame Co., engineers and machinists of Worcester, Mass., announce the removal of their offices to larger quarters at 149 Commercial street.

* * *

Nielson & Maxwell, Ltd., Glasgow, Scotland, iron and steel merchants, have established a branch office in this country at 136 Liberty street, New York City. James Gilchrist is in charge.

* * *

The Sharon Iron & Metal Co., of Sharon, has filed notice of change of its name to the Sharon-Warren Iron & Metal Co., of Sharon.

* * *

J. G. Eurengy & Co., have opened offices at 17 Battery place, New York City, to deal in iron and steel scrap.

* * *

The Walcott Lathe Co., Jackson, Mich., recently established a display room at 1316 Ontario street, Cleveland, with Frank H. Wheaton in charge.

"To Advance the Foundry Business"

Philadelphia Greets Foundrymen

BACK again in Philadelphia for the greatest of all its conventions and exhibitions—in the city where it was born 23 years ago—the American Foundrymen's association, thriving and alive with the busy spirit of the times bears evidence of the wisdom of co-operative organization.

Its success, measured in experience, the cumulative result of the exchange of knowledge, or translated in a monetary sense, is all that its founders and the pioneers of the casting industry might well have wished for it. Its prestige established, continuation now must be its watchword, continuation along the constructive and progressive lines which have placed it among the foremost trade organizations in the world, and which must make it a still more active force for the welfare of its members and the good of those whose interests are bound up with theirs.

A significant feature of the convention this year, will be the attendance of a number of visitors from abroad. The association's work and its exhibits are commanding the attention of some of the most prominent firms, foundrymen and metallurgists in European countries. Industrial America's interests are linked inseparably with those of other nations, and perhaps this quickened spirit and recognition of far-reaching relationship may foreshadow a still greater association, an international association to include the representative foundrymen of the world.

Thus time improves perspective. The declaration of dependence, that pledge of mutuality and helpfulness on the part of a small group of foundrymen in Philadelphia in 1896 was the foundation of an association which in 1919 has attained international fame, just as the principles of government enunciated in that city 143 years before now ring throughout the world.

Many of those identified with the organization of the association still are included among its membership. For those who have worked unstintingly "for the advancement of the foundry business" the twenty-fourth annual convention must be a source of great gratification.

The first convention was held in the Manufacturers' club, and there was no exhibit of foundry equipment. In 1916 in Cleveland 38,000 square feet of space was occupied by the exhibits; in 1917 in Boston, 44,000 square feet; in 1918 in Milwaukee, 42,000. And more than a month ago as much as 60,000 square feet of space had been reserved for the convention of 1919. Considered from the standpoint of exhibits, this represents a growth of nearly 33 per cent in one year! There is cause for congratulation.

But the big thought that must dominate the convention is progress, continued progress and a progress that counts the achievements of the past only as guide-posts to a greater future.

Quaker City, Association's Cradle

Men Prominent in the Formation of Philadelphia's Local Foundry Society Were Instrumental in Bringing About the First National Convention—Growth and Progress Throughout the Industry Have Followed

PHILADELPHIA'S history is intimately bound up with the birth and growth of the nation. The city is justly cherished as the birthplace and existing symbol of American independence. Established to champion the radical and then despised principle of religious freedom, the community continually has been a pioneer in social and industrial advancement. The first daily newspaper, the first circulating library, the first corporate bank, the first

JOHN A. PENTON — FRANCIS SCHUMANN — HOWARD EVANS

These officers of the American Foundrymen's association elected at the first convention in Philadelphia had been strongly instrumental in bringing about the formation of the national organization

National congress, President and National capital, and the immortal Declaration all are Philadelphia's own by history and association.

It is eminently fitting that Philadelphia, the cradle of independence, should have been the birthplace of the American Foundrymen's association. This statement sounds trite, but an analogy exists. Representatives from 13 aggrieved colonies of Great Britain chose Philadelphia in which to meet in council for protection. There they banded themselves together for mutual support and fathered certain principles which formed the groundwork of the nation. One hundred and twenty years later another group was gathered together, likewise for mutual help. These latter, representatives of the great casting industry, did not fear the oppression of a regal tyrant, nor the active opposition of any outside power. They were, however, bound by the shackles of adherence to age-old practice and held back by petty jealousy between individuals from the benefits of mutual co-operation and the interchange of ideas. Called together by Philadelphians, the foundrymen met in the first national convention in May, 1896, to seek means of correcting existing abuses and of advancing the industry through the interchange of ideas.

Six years before, in the later months of 1890, a few prominent foundrymen of Philadelphia had met together to discuss problems of common interest connected with the conduct of their business. These men for want of a better meeting place, congregated in a bar room. The idea which brought them together was the promotion of better fellowship among men in the same industry. Their underlying hope was that acquaintanceship would militate against price cutting, as it was ever easier to practice unfair business methods against strangers. These early meetings represented the first feeble stirring of the spirit which brought forth the American Foundrymen's association. The sessions were not always well attended for occasionally only the president and secretary met at the appointed time, but at every scheduled meeting "two or three were gathered together."

In July, 1891, the organization meeting of the Philadelphia Foundrymen's association was held in response to a call sent out by Howard Evans then with the J. Emerick Co. Among those found on the first official membership list are Harry Asbury; Thomas Glover, Morris Tasker & Co.; Harry Ruhland, Ruhland & Redman; Josiah Thompson, Josiah Thompson & Co.; A. C. Mott, Abram Cox Stove Co.; A. E. Outerbridge Jr., William Sellers & Co.; A. C. Pessano, Geo. V. Cresson Co.; Godfrey R. Redmann, Otis Elevator Co.; W. F. Sauter, American Engineering Co.; W. H. Ridgway, C. Ridgway & Son Co., Coatsville, Pa.; James S. Stirling, Hilles & Jones Co., Wilmington, Del.; Walter T. Bickley, Penn Steel Casting & Machinery Co., Chester, Pa.; J. S. Hibbs, J. W. Parson Co.; Samuel J. Creswell, S. T. Creswell Iron Works; S. A. Waters, Goodell & Waters; Thomas Devlin, Thomas Devlin & Co.; James M. Blankley, Way & Blankley; Francis Schumann, Tacony Iron & Metal Co., Tacony, Philadelphia; Justice H. Schwacke, Wm. Sellers & Co.; W. S.

Hollowell, Harrison Safety Boiler Co.; E. E. Brown, E. E. Brown & Co.; T. Howard Sheeler, Sheeler-Hemsher Co.; Wilfred Lewis, Tabor Mfg. Co.; J. D. Harvesy, Monarch Engineering & Mfg. Co.

These and a few others formed the nucleus about which the Philadelphia association was built up. Most of them were identified prominently with the growth of the national organization and some few of them still are active along this line.

The bar room meetings were abandoned as being subject to misinterpretation, and a more commodious meeting place was sought and obtained at the Manufacturers' club which had been erected a short time previously. Regular meetings resulted in increased attendance and the association was established upon a firm footing.

In 1896, the Philadelphia Foundrymen's association conceived the idea of a national organization formed of those engaged in the foundry industry. The benefits of the local body were so apparent that it was the earnest desire of those broad-thinking men to bring within its influence all who were engaged in manufacturing castings. Accordingly a movement was started and an active campaign inaugurated which was carried out through the earnest personal efforts of a number of individuals. Chief among these were Francis Schumann and Howard Evans, president and secretary of the Philadelphia association, and John Penton, editor and proprietor of *The Foundry,* which at that time was published in Detroit. The Western Foundrymen's association joined with Philadelphia in arranging for a meeting to form a national body.

The true spirit of Philadelphia, the City of Brotherly Love, was stated in the aims of the meeting set forth in the invitation which was sent to prominent foundrymen in all parts of the United States and Canada. The invitation stated:

"The object of this convention is to bring about a more friendly feeling among the foundrymen of this country and to present and discuss papers on interesting subjects and to encourage the formation of foundry associations in every part of the United States where it is possible to do so, believing in the end good results must follow, the idea being to advance the foundry business in every way."

The ideals upon which this great industrial association was built were correctly stated in this announcement. The interpretation of these ideals and the growth even beyond the hopes of its founders reflect credit upon the vision of those who have consistently adhered to the set purpose, "to advance the foundry business in every way."

In his keynote speech welcoming the delegates on May 12, 1896, Francis Schumann pointed out that those present represented an industry consisting of nearly 4000 separate establishments, employing 120,000 persons. These produced some 2,600,000 castings with a total disbursement for labor of $114,000,000 upon an aggregate invested capital of $115,000,000. He pointed out that the excessive, and in some cases artificial competition had brought a general movement toward combinations for the purpose of combating "unrestrained and dangerous rivalry." The downward course of prices had resulted in deteriorating the character of products and undermining the finer sense of honor in the individuals so competing. The national organization was to correct these conditions.

Landmarks of Progress

NO better evidence is offered of progress in the foundry industry during the last decade than is presented by a contrast of the accompanying program delivered in 1896, *with that prepared for the* 1919 *convention of American foundrymen. The chemistry of iron the use of such common equipment as traveling cranes, compressed air, sand blast and molding machines were just beginning to appear on the horizon of better methods. The influence of the American Foundrymen's association needs no better tribute than that offered by a consideration of the progress made in the industry between the first and twenty-fourth annual meetings.*

The subjects treated upon at the 1896 *meeting were as follows:*

"Chemistry of Iron, with Determinations and Their Value," by Charles James, M. E., of Henry Disston & Sons, Philadelphia, and W. C. Henderson chemist, of Thomas Devlin & Co., Philadelphia.

"The Strength of Cast Iron, with Samples," by W. J. Keep, Detroit, Mich.

"Apprenticeships, Their Value and How to Make New Molders," by D. J. Matlack, of I. P. Morris Co.

"Foundry Cranes, the Different Power Used to Drive Them," accompanied by lantern slides, by A. E. Outerbridge, Jr., of Wm. Sellers & Co., Inc., Philadelphia.

"Acid Open Hearth vs. Basic Open Hearth and the Wahand-Legensel Bessemer Process," by Jos. Hartshorne, M. E., of Pottstown, Pa.

"The Air Compressor for Use in the Foundry," by C. W. Shields, of Ingersoll, Sergeant Drill Co., Easton, Pa.

"Cupolas and Cupola Practice Up to Date," by Dr. Edw. Kirk, Philadelphia.

"Entertainment of the Delegates," by Mr. John Birkinbine, M. E., of Philadelphia.

"Utility and Advancement of Green Dry and Loam Sand Molding," by Thomas D. West, Sharpsville, Pa.

"Gear Molding and Gear Molding Machines," by S. Grove, of Taylor, Wilson & Co., Pittsburgh, Pa.

"The Sand Blast for Cleaning Castings," by Fred C. Brooksbank, of Ward & Nash, Boston, Mass.

"Molding Machines and Their Appreciation," by Harris Tabor, of Tabor Mfg. Co., of Elizabeth, N. J.

It was felt at that time that a more friendly feeling between the men engaged in the same work would tend to more satisfactory prices through the reduction of reckless bidding and a better knowledge of costs of production. Even at this early date the need of standard physical tests for cast iron was strongly expressed. Labor difficulties, too, engaged the attention of the delegates. The question of convict labor was presented and informal conferences between delegates brought out plans to avoid strikes and lockouts and to enforce a universal apprenticeship system. It thus may be seen that the first steps of the organization were directed along the paths of material and practical rather than technical and business advance. The transition and broadening of activities of the association since its inception will be appreciated by those who are familiar with the work of the organization at the present time.

The first meeting was held at the Manufacturers' club, where the guests registered and were assigned a numbered badge. The numbers with the delegates' names to correspond were printed in the *Daily Foundry* which was issued on each of the three days of the convention. Francis Schumann, Tacony Iron & Metal Co., Tacony, Philadelphia, and Howard Evans, J. W. Paxson & Co., Philadelphia, were elected unanimously as chairman and secretary respectively to preside during the meeting. Upon resolution presented by F. A. Riehle, Riehle Bros., Philadelphia, a committee of five was appointed to draw up a suitable constitution to govern the national association. The members of this committee were A. Sorge Jr., Chicago; R. Taylor, Pittsburgh; Frank A. Magee, Boston; J. Best, Montreal, and C. S. Bell, Hillsboro, Ohio.

The discussion of a suitable title for the organization brought out the statement that this was not to be a national association, because such a title might carry the intimation that membership was confined to the United States alone. The hope was expressed that a large number of foundrymen, experts in their line, who were located in Canada, would cooperate in the work of the association. The wisdom of this course has been fully vindicated.

Interesting sessions were held where discussions followed the lines indicated by the program which is shown

on page 101. The demonstration of processes for determining the chemical constituents of iron was stated to be one of the most interesting features of the meeting. The first feeble stirring of interest in the vital scientific control of metal mixtures was evidenced at this time. Previously iron was judged by fracture in most cases and with a few exceptions the effects of silicon, manganese, sulphur and phosphorus were a closed book to the practical foundryman. Pioneers such as W. J. Keep, Thomas D. West and others had begun to exert an influence toward technical knowledge which grew through their activity in the association. The first steps in this direction at the first convention aroused the greatest interest and appreciation among members.

Labor even at that day occasioned anxiety to foundry executives. However, the phases discussed concerned the concrete points of apprenticeship, classes of labor and wages, rather than the broader aspects of increased output, and efficiency. Compressed air was sufficiently novel to invite attention and discussion. Cranes and molding machines still were in the early stages of development. Jib cranes were defended against the opinion sometimes expressed that they were becoming obsolete due to the advances in the "traveling" crane, but the statement was made that the overhead type had its uses in heavy foundries. The generally used cranes of the day were shown to be steam-driven jibs with an occasional electric or hydraulic pillar crane. The paper on molding machines attracted great interest as foundrymen were coming to realize that the fraction of a cent on the cost of making a casting was a most important item in meeting the keen competition that then existed. This factor rather than the saving in manpower was the motive which attracted them to labor-saving machinery.

First Officers Prominent

The third day's session was occupied in discussing the constitution and electing officers. Francis Schumann who had been president of the Philadelphia body since its formation was chosen as the first president of the American Foundrymen's association. Mr. Schumann was at that time in his fifty-second year. He had been an engineer with railroad experience. He served under General Meade in the Army of the Potomac during the Civil War and later had been superintendent and manager of a foundry and machine shop. Mr. Schumann had established the firm of Schumann & Lynch, Tacony, Philadelphia, which later became the Tacony Iron & Metal Co. Mr. Schumann served as president and general manager of this company.

Howard Evans, who was a partner in the firm of J. W. Paxson & Co. and had been in the foundry supply business all of his life, was chosen treasurer of the national organization. At the time of the convention he was secretary of the Philadelphia section and to his energy and ability is due much of the credit for the successful launching of the American Foundrymen's association. John A. Penton, editor and proprietor of *The Foundry,* was elected secretary.

Twenty-three states were represented by 350 delegates registered. The association desired to establish active units in various parts of the country. Accordingly vice presidents were elected to lead the geographical sections as follows: New England, F. W. Gibby, Boston; Middle States, Robert G. Taylor, Pittsburgh; Southern States, Henry Clay Evans, Chattanooga; Central Western States, John M. Sweeney, Chicago; Southwestern States, W. S. Mosher, Dallas, Tex.; Pacific States, Irving Scott, San Francisco; Canada, Joseph Best, Montreal.

Eleven years after this initial meeting the American Foundrymen's association again came together in Philadelphia. In the interim many changes had been made in policy and details of organization but the underlying principles of the body were the same. All questions of labor as concerned wages and hours had been banished and the price question too was dropped as without the scope of a national association. All questions brought before the sessions of the American Foundrymen's association after about 1900 concerned the production of the best possible castings at the lowest shop cost. In 1907 when the second Philadelphia convention was held, the American Foundrymen's association was recognized as a factor in the evolution of the industry. Dr. Richard Moldenke, who was secretary of the association at this time said:

"To the American Foundrymen's

JOSIAH THOMPSON THOMAS D. WEST W. J. KEEP

These men, two of whom were most intimately identified with the development of the science of founding, were among the active delegates to the first convention

Those Who Attended First Convention

Charles Ashbury, Enterprise Mfg. Co., Philadelphia.
Robert Allison, Franklin Iron Works, Port Carbon, Pa.
George R. Allen, Thirteenth and Buttonwood streets, Philadelphia.
Alonzo D. Amsden, Phoenix Foundry, Providence.
William Adams, Wm. Adams & Co., Ninth and Girard avenue, Philadelphia.
James W. Arrote Jr., Standard Mfg. Co., Pittsburgh.
William W. Ackerman, Samuel L. Moore & Sons, Eilzabethport, N. J.
E. T. Adams, Juniata Furnace & Foundry Co., Marlborough and Beach streets, Philadelphia.
James Anderson, Sotter Bros., Pottstown, Pa.
K. J. Bougher, J. W. Paxson & Co., Philadelphia.
John Braun, Philadelphia Lawn Mower Co., Twenty-third and Turner streets, Philadelphia.
James H. Blankley, Blankley Bros. & Co., Twenty-second and Allegheny avenue, Philadelphia.
Elmer E. Brown, E. E. Brown & Co., McKean and Meadow streets, Philadelphia.
John T. Brown, Damascus Bronze Co., Pittsburgh.
Andrew Banholzer, Birmingham Machine & Foundry Co., Birmingham, Ala.
T. S. Bishop, Russell & Irwin Mfg. Co., New Britain, Conn.
J. J. Burgen, Lane Mfg. Co., Montpelier, Vt.
John W. Burr, Burr & Houston Co., Brooklyn.
James A. Beckett, W. A. Wood Mowing & Reaping Co., Hoosick Falls, N. Y.
Clinton S. Buckley, Damascus Bronze Co., Pittsburgh.
Joseph Best, Warden King & Son, Montreal, Canada.
John F. Brayer, Co-operative Foundry Co., Rochester, N. Y.
Howard J. Bing, 3737 Filbert street, Philadelphia.
Frank N. Brayer, Co-operative Foundry Co., Rochester, N. Y.
F. C. Brooksbank, Ward & Nash, Riverton, N. J.
Felix Brown Jr., A. & F. Brown, Elizabethport, N. J.
R. D. Berge, Clinton Iron & Steel Co., New York.
James Bailey, Wilmington Malleable Iron Co., Wilmington, Del.
W. P. Barba, Midvale Steel Co., Nicetown, Philadelphia.
C. R. Baird, C. R. Baird & Co., Philadelphia.
C. S. Bell, C. S. Bell Co., Hillsboro, O.
J. A. Buckwalter, the Buckwalter Stove Co., Royersford, Pa.

Peter Lindsey, Manayunk, Philadelphia.
Peter Lindsey Jr., Manayunk, Philadelphia.
K. J. Lambert, Syracuse Chilled Plow Co., Syracuse, N. Y.
John A. Logan, Jones & Laughlin, Ltd., Pittsburgh.
George H. Lincoln, G. H. Lincoln & Co., Boston.

(Concluded on Page 105)

A. C. MOTT WALTER WOOD WILLIAM FERGUSON

History is a summation of commanding personalities, and the progress of the industry may be traced by the achievements of individuals who are engaged in its acitivities

association may be directly ascribed the change in the purchase and sale of pig iron by analysis instead of by fracture. The metallurgists all over the world, working in iron and steel, were benefited by the standardizing bureau of the association, originated and watched over by Thomas D. West, an ex-president of this body. The standardized drillings made by this bureau were admitted as authoritative in disputes concerning the correctness of analyses. The work of this bureau has been taken over by the United States government, the drillings of cast iron, duly standardized, being distributed by the bureau of standards at the present time. Standard methods of analyzing cast iron now are in the course of completion.

* * *

"Much work has been done on systems of apprenticeship, trade schools, cost systems, and instruction papers intended to help the foundryman educate younger workmen. In general, the work of the association has been directed toward awakening the great foundry industry to the need of more and better trained men to man the shops."

Thought Trend Changed

W. H. McFadden, Mackintosh, Hemphill & Co., Pittsburgh, who had been elected at the Cleveland convention in 1906, presided at the second Philadelphia meeting. Dr. Richard Moldenke was secretary at this time, C. J. Caley, John W. Burr, Stanley G. Flagg Jr., J. H. Whiting, W. J. Keep, J. P. Golden, Lawrence L. Anthes and T. W. Sheriffs all were vice presidents.

The program followed includes papers which give an interesting sidelight on the trend of thought in the association and the industry 12 years ago. The question of technical school training on foundry subjects was presented by five speakers. The design and construction of foundry buildings and the various departments therein were dealt with in five papers. The metallurgy of iron, steel and nonferrous castings was discussed by such men as William M. Saunders, Charles J. Caley, C. E. Johnson, James F. Webb, and H. E. Diller. The business side of the gray-iron, steel, and malleable foundry was discussed by

Thomas D. West, W. M. Carr and Dr. Richard Moldenke. respectively. Two papers which were presented gave indication of the growing international influence of the association. These were on a new method of preparing molding sand, and molding machines two subjects which were presented by E. Ronceray, Paris, France.

Practically every state in the union was represented among the 1391 registered visitors at the convention, and over 100 foundrymen from Canada were in attendance. Thomas Devlin, as president of the Philadelphia association welcomed the members of the association at the initial session. Howard Evans, who had been the first secretary of the Philadelphia body, still occupied the same office. Over 65 different manufacturers exhibited their products at the supply show which was conducted in connection with this convention.

Eastern Pennsylvania Rich in Romance of Iron

By Richard Peters Jr.

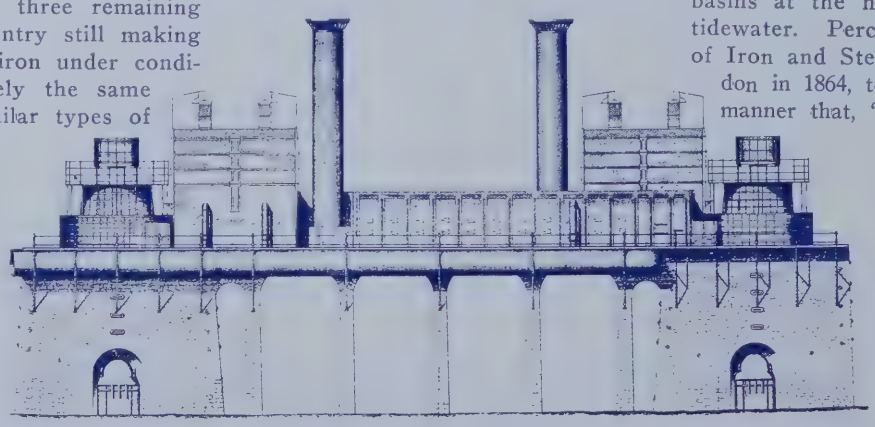
OLD Pennsylvania! Her sons, like her soil, rough outside but solid stuff within; plenty of coal to warm her friends; plenty of iron to cool her enemies!" The position of the Keystone state as an iron producer may be truly epitomized by the foregoing toast, proposed by William Lyman, an eminent ironmaster of Pottsville on the occasion of celebrating the successful making of pig iron with anthracite coal as fuel in 1839. From the early days of the province down through the great world war just past, the pig iron from blast furnaces of the commonwealth of Pennsylvania has had the premier position in furnishing the sinews of war in the struggles to prove to mankind that "right makes might." The merchant pig-iron industry of eastern Pennsylvania had its foundation in the primitive forges and furnaces scattered through the almost unbroken forests of the province. The product of these early enterprises in the shape of the crude iron or direct castings was exchanged through the markets of trade for the necessities of life, or its luxuries, depending upon the prosperity of the times or the vanities of the ironmaster. The history of the early days of the iron industry prior to the Revolution is full of romantic interest and it is gratifying to find this subject is exceedingly well treated in an interesting volume published recently by the Pennsylvania Society of Colonial Dames of America, entitled, "The Forges and Furnaces in the Province of Pennsylvania." The first blast furnace in Pennsylvania was located at Colebrookdale near Pottstown, in 1720, although history tells us that the iron industry had its start four years

RUINS OF CODORUS FURNACE IN YORK COUNTY, PA., STILL STANDING. NOTE THE HOT BLAST OVEN BUILT ON TOP OF THE STONE STACK, TYPICAL CONSTRUCTION BEFORE CIVIL WAR

CRANE IRON WORKS AT CATASAUQUA, PA., AS IT APPEARED IN 1852. THIS WAS ONE OF THE LARGEST OF THE PIONEER PLANTS IN AMERICA

previous by the erection of the Manatawny Forge.

The early furnaces were built of stone in the shape of a truncated pyramid, and lined usually with sandstone. These primitive stacks ranged from 20 to 40 feet in height and were located by a hillside to afford an easy method of charging the raw materials. The ore was supplied from nearby banks where the richer material was picked out, while the neighboring forests yielded wood for the charcoal. These furnaces were operated with cold blast blown through one tuyere with huge bellows or wooden tubs, the power being generated by a water wheel. The tops were open and at night the countryside was lighted up by the flames which, like a mythical oriflamme, rose and fell with the pulsations of the blast.



Five or six tons of iron a day was a good output, and the product was usually conveyed in wagons through the country to market, or floated on barges down some nearby stream. The ruins of a number of these ancient stacks are still scattered in remote spots through the state, but it is interesting to note that at Curtin and Milesburg in the Bald Eagle valley are two of the three remaining furnaces in this country still making cold blast charcoal iron under conditions almost precisely the same as did those of similar types of 125 years ago. The early iron industry of the state developed rapidly through the southeastern section in the territory which now comprises Cumberland, Berks, Bucks, Chester, Lancaster and Montgomery counties. During its advancing stages many of the early operators augmented their plants by adding puddle and rolling mills to refine and work up the metal for the trade.

These industries flourished in the more favored localities until the advent of steel brought about competition which they could no longer meet, resulting in the abandonment of a large majority of the plants. There were iron manufacturers also who were content to allow others to convert the crude pig metal to the uses of the trade, and whose plants were so located as to combat the effects of changing conditions. By keeping abreast of developments in the smelting process, and by taking advantage of their natural location in regard to source of supply of materials and the market, these more favored works became the forerunners of the merchant furnace plants of today.

As an example, attention is called to the furnace of the Robesonia Iron Co., at Robesonia, whose beginning dates back from 1793. This stack when originally built was known as the Reading furnace and, although the enterprise changed hands several times, there always has been a pig iron producer on the site. Robesonia furnace, which draws its main source of ore supply from the famous Cornwall deposits, enjoys a unique mineral right which has stood the test of years of litigation and still operates. This grant provided that the owners should have sufficient ore to operate one furnace "as long as grass grows and water runs." A thoroughly modern plant now occupies the site at Robesonia in place of the crude stone stack built 125 years ago in a clearing in the Lebanon valley.

After the invention of the hot blast in 1828, the next era of development was brought about by the use of anthracite coal as a fuel in the blast furnace. Ironmakers in many localities tried the experiment of replacing the charcoal fuel with anthracite, but it remained for William Lyman to have the honor of operating successfully the Pioneer furnace at Pottsville for a period of three months in 1839. A view of this plant at a somewhat later date appears with this article.

It was natural that the valleys of the Lehigh, Schuylkill and lower Susquehanna rivers should quickly respond to the development of the anthracite iron industry, with the building of canals from the coal basins at the heads of the rivers to tidewater. Percy, in his "Metallurgy of Iron and Steel," published in London in 1864, tells us in a picturesque manner that, "the principal manufacture (in America) must always cling to the Lehigh, Schuylkill and lower Susquehanna valleys in Pennsylvania where the ore is abundant, the coal near at hand and the flux on the spot; where the whole land is a

ELEVATION OF THOMAS IRON CO.'S PLANT AT HOKENDAUQUA, PA., IN 1865. THIS DRAWING SHOWS THE TYPICAL CONSTRUCTION OF EARLY LEHIGH VALLEY ANTHRACITE FURNACES

garden and, therefore, food cheap and labor plentiful and the great seaports not far off."

Indeed, there was a period when there could be counted along the banks of the Lehigh river what was equivalent to a furnace for every mile of the distance between Mauch Chunk and Easton.

Mr. Percy described the furnace plant of the Thomas Iron Co., at Hokendauqua. An elevation plan of this plant is reproduced from the book quoted, because it represents the typical construction of the anthracite furnaces as they were built in the fifties. The hot blast ovens and the boilers were erected on huge masonry arches, it being apparent that the early engineers felt there would be a greater saving of gas by having these accessories as close to the tunnel head as possible. There still stands one of the arches of the old Coleraine furnace along the Lehigh river between Bethelehem and Easton. Professor Lesley in his treatise "American Iron Manufacture," published in 1859, gives a poetical description of one of the old Lehigh valley plants, now long since torn down:

"The Allentown anthracite steam furnaces rise together from the river plane in the grandest and most picturesque style, throwing into shade many of the castles of Europe. No finer object of art invites the artist. The still higher pile of the Crane works on the opposite side of the river a little higher up, is rendered less striking by the vicinity of the hills. The Allentown works rise undisturbed and unrivaled by surrounding heights, a world of stone and iron in the air, its summits crowned with tall chimneys like the turrets of Caernarvon, flames issuing from its tunnel heads, and cars traveling up and down its planes, long trains of ore mules passing to and fro across its lofty bridges, while other trains of railroad cars wait below to carry off its iron. The repose of bygone centuries seems to sit upon its immense walls, while the roaring energy of the present day fills it with a truer and better life than the revelry of Kenilworth or the chivalry of Heidelberg. Its archways conceal a perfected alchemy where the spirit of the wind converts earth to iron and dross to gold, condensing around this pile of matter a little world of intellectual and moral happiness and energy to which poets and statesmen might profitably travel to learn more than is read in books or declaimed in congress."

Doubtless the sublime utterances of the good professor may sound ludicrous to our more prosaic way of looking at these things, but to somewhat appreciate Lesley's descriptions, one only has to refer to the illustrations of the Allentown, Crane and Thomas plants, reproduced from old ambrotypes in Henry's "History of the Lehigh Valley."

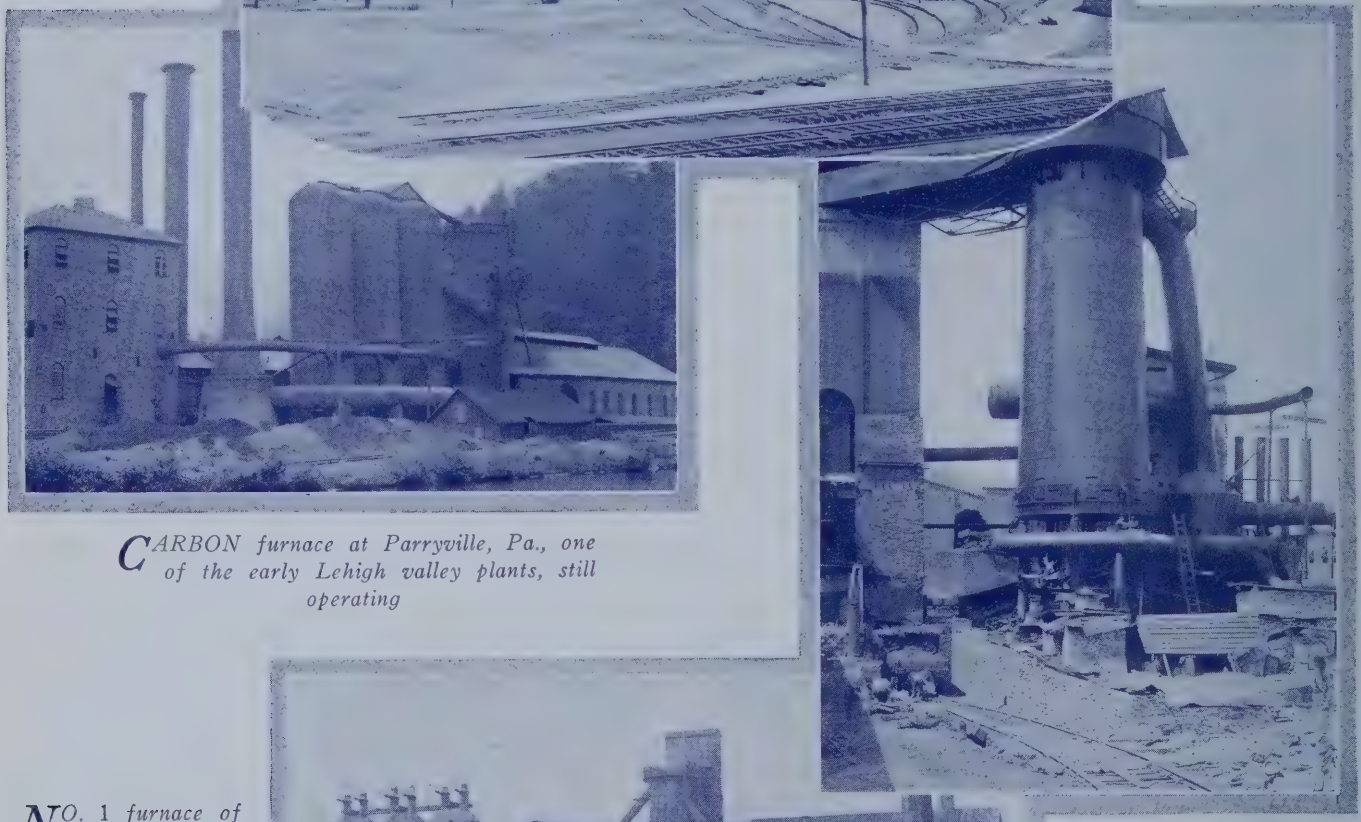
While Mr. Lyman had successfully made iron with anthracite as fuel at the Pioneer furnace at Pottsville, it remained for the present two leading merchant iron industries of the Lehigh valley to establish works which have continued operating ever since.

PIONEER FURNACES AT POTTSVILLE, PA., FROM AN ENGRAVING MADE ABOUT 1875. AT THIS PLANT PIG IRON WAS MADE SUCCESSFULLY BY THE USE OF ANTHRACITE IN 1839

In 1837, David Thomas at the Yniscedwyn furnace in Wales, commercially solved the problem of smelting iron with anthracite by utilizing the hot blast invented by Neilson 10 years previous. The news of this successful venture having reached this country, arrangements were made by the Lehigh Coal & Navigation Co., whose mines and waterways needed development, to send Erskine Hazard of their company to Europe to engage Mr. Thomas to come to America.

George Crane was a part owner of the Yniscedwyn works and when the first organization of the new enterprise was effected it was determined that Mr. Crane should be honored by having the company bear his name. Accordingly the Lehigh-Crane Iron Co. was organized and David Thomas was engaged to come to this country to establish a furnace on the Lehigh river. Mr. Thomas arrived with his family in the early summer of 1839 and immediately started to lay out the first furnace at Catasauqua. His son, the late Samuel Thomas, described the building of this plant and its subsequent starting in an interesting monograph published some 20 years ago.

On July 4, 1840, the first cast of iron was made at Catasauqua, and from that day to the present Crane iron has always been on the market. From the small furnace originally built the plant grew until at one time it had five stacks on the banks of the Lehigh canal. Changes and improvements in the ensuing years reduced the units to only two, although the production was inversely increased. At present the plant is again being modernized by an addition of a skip hoist with other labor-saving devices. Leonard Peckitt, president of the Empire Steel & Iron Co., which operates the Crane Iron Works, has been its leading spirit for many years. Mr. Peckitt's activities in the recent war as a member of the committee on distribution of pig iron will long be remembered by the foundry trade and the eastern furnace operators, as he had the entire responsibility of allocating pig iron in that district under the direction of the war industries board. The Empire company in addition to owning the Crane works, operates the Topton and Macungie furnaces, and also has a modern plant at Oxford, N. J., in which district are located the principal ore mines of the company.



David Thomas was known as "the father of the American anthracite iron industry," and after he had successfully started the Crane works, he joined with 25 other enterprising citizens of the Lehigh valley in the formation of the Thomas Iron Co., in February, 1854. The first two furnaces were built at Hokendauqua and were put in operation in June and October, 1855. Later four other stacks were added, and subsequently the company absorbed the Lock Ridge Iron Co., operating two furnaces at Alburtis, the Keystone furnace at Island Park near Easton, and the Sau-

DURHAM furnace, built by Cooper & Hewitt in 1874-1875 on a site where iron had been manufactured since 1727

HECLA furnace at Milesburg, Pa., built in 1864. It still is in operation, making cold-blast charcoal iron

con Iron Co., located at Hellertown.

At the plant of the Saucon Iron Co. was erected probably one of the first of the furnaces in this country to be built with an iron shell on cast columns. The original plan of the Hokendauqua plant was completely modified, and in place of the six stone stacks originally erected there were two modern skip-filled ones. Dr. B. F. Fackenthal, of Rieglesville, who is prominent in historical research regarding the early iron industry, wrote an interesting history of the Thomas Iron Co. on the fiftieth anniversary of the organization of the company, of which he was president at the time. The Keystone furnace recently was acquired by the Northern Ore Co., and is being repaired for further operation.

In commenting on the Thomas works, Mr. Lesley in 1857 said:

"The No. 1 furnace made 9731¼ tons while the No. 2 furnace produced 8366¾ tons. The consumate skill of long experience of the manager must no doubt avoid or redress the ordinary troubles of the process, but this immense production even from these first-class stacks can be accounted for only by the enormous consumption of oxygen which they are allowed. In a word, here stands the demonstration that a large and well built crucible properly stocked with good ores and properly blown with power to spare, must be a great and continual success."

At this point, may be mentioned an interesting incident connected with the eastern Pennsylvania iron market of 1879 which had started early in that year around $16 per ton. There was a sudden demand for pig iron which could not be met and the price was forced up steadily to $43. The owners of one ironmaking enterprise having seen that the high prices in this country were resulting in a large tonnage of scrap being imported from abroad, decided that they would forestall further movements by making a liberal cut in the price of their pig iron. Accordingly they notified all their trade that immediately the price of their iron would be reduced $10 a ton. This startling announcement from such a producer had the effect of immediately stopping all buying. The market fell more rapidly than it had advanced and it did not reach an equilibrium until the price was around $22. Not many years later the company liquidated and dismantled its plant at Glendon, which had consisted of five furnaces.

At Parryville, just above the picturesque gap where the Lehigh river breaks through Blue mountain, is located the Carbon furnace. Built in 1869, it is the survivor of a plant of three stacks which at one time were connected with a pipe foundry, and after several changes in ownership now is operated by the Carbon Furnace Co. This furnace is stocked by probably one of the last of the water hoists, its working dependent upon the alternate filling and emptying of a square tank forming the bottom of the cage. This unique arrangement is quite automatic and operates with little or no cost, as the water is under pressure from the surrounding hills.

Establish More Furnaces

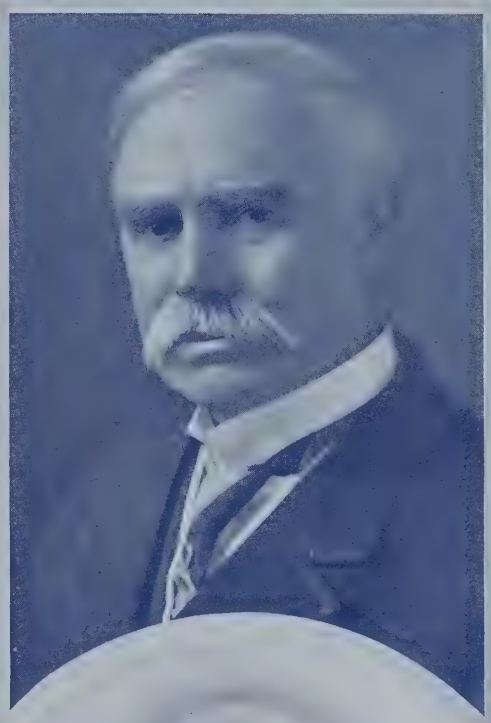
In the lower Susquehanna valley the successful use of anthracite as fuel caused a number of furnaces to be built, particularly in Lancaster county. Of the several works established, the Chickies stacks were probably of greatest interest, as their career extended from 1845 to 1900. The original one of these furnaces, called "Chikiswalungo," was erected by Henry Haldeman in 1845, and for over 47 years it was never out of blast for more than six months at a time, which included the entire rebuilding of the plant at one period. During all the time the Chickies furnaces were in blast they were operated by the family of Horace L. Haldeman, now the president of the Pulaski Iron Co. The latter has in his possession interesting notes and records of the operations of the company. General Haldeman, while now guiding the destinies of this prominent Virginia interest, directs it from Philadelphia, and may well be claimed by the eastern Pennsylvania iron trade as one of its own. His active connection with the old Chickies plant for many years, and his association with the Pennsylvania iron men of his day, have made him a prominent figure in the pig iron fraternity. He is one of the few men living who operated furnaces through the radically changing conditions of the pig iron business and is still active today.

Vesta furnace at Marietta was built in 1868, and after passing through several changes in ownership was abandoned in 1903, to be revived and rebuilt in 1917 by the Lavino Furnace Co., which used it to manufacture ferromanganese.

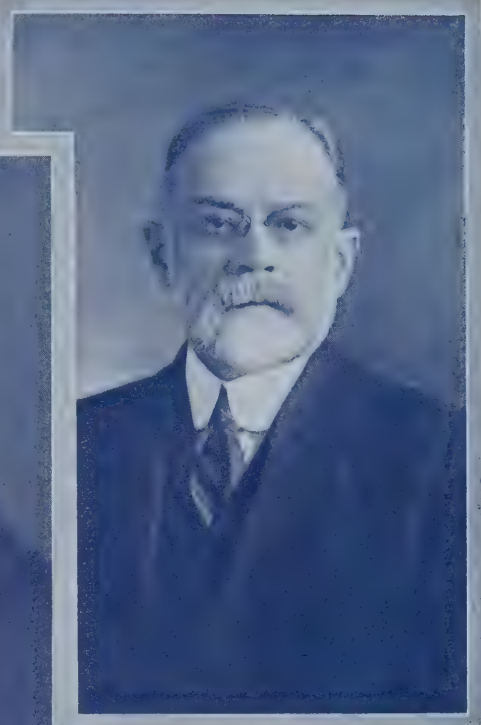
Lebanon has always been an iron center, due to its close proximity to the Cornwall ore banks. The original Cornwall furnace was built in 1742 and is still preserved as a relic. The Coleman and Grubb families were prominent in the establishment of iron works in this district and operated the Bird Coleman, Colebrook, North Cornwall and North Lebanon furnaces. At the present time all the various plants in the Cornwall district, with one exception, have passed into the hands of the Bethlehem Steel Co. and are used by this corporation for supplying its customers with foundry iron.

In the Schuylkill valley the Warwick plant has had the most interesting history. Originally built in 1737 some 10 miles from Pottstown, the old Warwick furnace was actively engaged in casting cannon for the Revolution and for many years was an important industry. In 1875 the first furnace of the present plant was built but not on the same site and by other interests who recognized the fame of the older enterprise. Through the energies of the late Edgar S. Cook the Warwick furnace rapidly took a foremost place in the industry and many important experiments were made at that plant. In 1900 Mr. Cook erected the first 100-foot furnace in the East, which commanded the keenest attention of the iron men at the time. The present plant at Pottstown consists of two modern furnaces, and while they are controlled by the Eastern Steel Co., they belong to the foundry iron producing class, in that much of their product still finds its way to local markets.

Further up the Schuylkill river at Birdsboro is the furnace of the E. & G. Brooke Iron Co., the operations of which have been guided by the Brooke family for several generations. The present plant has succeeded three old stacks built in the seventies which had a total output of only one-half



Prize Photographs of Old Iron Works



THIS comprehensive and authoritative account of the development of the merchant iron industry of eastern Pennsylvania is illustrated with some of the oldest and most treasured photographs in the possession of those whose interests have been identified with the industry. The photographs were obtained from the collections of Horace L. Haldeman, president, Pulaski Iron Co., Philadelphia; Harry Firmstone, Longdale, Va.; Birkinbine Engineering Offices; Frank C. Roberts & Co.; B. F. Fackenthal Jr.; Robert C. Lea & Co.; H. F. Hallman; J. S. Stillman, of the Empire Steel & Iron Co.; J. E. Rotthaus, of the Thomas Iron Co. and the author of the article.

LEONARD PECKITT, president, Empire Steel & Iron Co., who served as eastern representative on pig iron during war

JOSEPH E. THROPP, Pennsylvania's only surviving iron master

HORACE L. HALDEMAN, of an historic family of Pennsylvania ironmasters, now president of Pulaski Iron Co.

B F. FACKENTHAL JR., who as president guided the Thomas Iron Co.'s development for two decades

EDGAR S. COOK, who built the first 100-foot stack in the East. Mr. Cook died in 1917

DAVID THOMAS, known as the founder of the American anthracite iron industry and who, as a practical iron man, started the Crane Iron Works and Thomas Iron Co. He was born at Tyllwyd, South Wales, Eng., Nov. 3, 1794, and died June 20, 1882

of what the modern Brooke furnace produces today.

Pottsville, Reading, Leesport, Norristown and other towns along the Schuylkill have had their vicissitudes in the iron trade, and the older men in the business may still recall the brand names of Annville, Edgehill, Henry Clay, Merion, Monocacy, Moselum, Pioneer, Plymouth, Lucinda and William Penn, all of which have been out of the market for many years. The Reading Iron Co. operates the Keystone furnace at Reading and also the plant at Emaus.

At Swedeland, a few miles above Philadelphia, are the Swede furnaces, formerly operated by the Philadelphia & Reading Coal & Iron Co., which corporation at one period was active in manufacturing pig iron. Professor Lesley in his work previously quoted says:

"The Swede Iron Co. Nos. 1 and 2, form a noble pile visible from afar on the plane of the right bank of the Schuylkill. The double stack with its lofty round arches is as fine a study in its way for artists as the Allentown stacks, gaining in effective height what it lacks in width and mass."

These furnaces were later operated by the Richard Heckscher & Sons Co., but no part exists today of these old works. They have been completely replaced by a thoroughly modern plant of three furnaces served with by-product coke ovens, and are operated as an adjunct to the plant of the Alan Wood Iron & Steel Co., across the river, with which they are connected by a convenient hot-metal bridge.

Figured in Revolution

For many years the Durham furnace at Riegelsville in Bucks county enjoyed the distinction of being the most easterly plant in the state. A furnace stood there from 1727 to 1912, and much of interest can be written of the history of the Durham plant. The Durham flat boats, used for transporting the pig metal in the olden days, figured in Washington's historic crossing of the Delaware. Dr. Fackenthal, who resides near the site of the old Durham works, has made a study of old stove plates cast at the early Pennsylvania furnaces, and has been able in many cases to locate the possible place of manufacture of these castings by careful analysis of the iron from which they were made. From his knowledge of the peculiarity of the analysis of the ores which were in the neighborhood of the old furnaces, he could determine the character of iron that was produced, and hence could check the probable origin of the stove plate castings.

With the passing of Durham and the demolishing in 1890 of the blast furnace that was built in the Kensington district of Philadelphia in 1873, the plant at Chester became the only furnace on the Delaware river. Originally built in 1880 as an adjunct to the Chester Rolling Mills, it was in its day the most modern of all the eastern Pennsylvania furnaces, and had the distinction of being one of the first to produce what is now known as low phosphorus iron. The writer's father, long connected with this plant, is authority for the interesting information that at these mills were rolled plates for the first American steel squadron, the ATLANTA, BOSTON, CHICAGO and DOLPHIN, the steel being made partly from iron produced at the local furnace. The late S. T. Wellman developed at this plant his inventions which have resulted in great saving in the cost of producing steel. The rolling mills long since have passed into history but the original furnace plant with a few modern additions still produces pig iron and has been operated by the Delaware River Steel Co. for the past decade.

In the eastern slopes of the Alleghenies are a number of furnace plants the output from which finds its way to the eastern foundry markets. The most important in this district is operated individually by Joseph Earlston Thropp, whose position in the trade is unique, in that he is today the only actual ironmaster of the state. Mr. Thropp has extensive coal and iron holdings in Bedford county, having acquired some years ago the idle plants of the Saxton Furnace Co., at Saxton, and the Everett Iron Co., at Everett, both of which he completely remodeled. Mr. Thropp gained his early practical experience in the seventies at J. B. Morehead's works in the Schuylkill valley, and later operated the Edge Hill furnace as lessee. At Riddlesburg, also in Bedford county, the Colonial Iron Co. has a thoroughly modern furnace erected on the site of the two stone stacks built in 1869 and 1870 by the Kemble Coal & Iron Co. The Emporium furnace in Cameron county was built in 1888 by the Cameron Iron & Coal Co., and passed through several ownerships before it was leased by A. Brady and operated as the Emporium Iron Co. The Bellefonte and Nittany furnaces, built in 1887 in Center county, had checkered careers and were abandoned and dismantled a few years ago.

During the decade from 1870 to 1880 occurred important changes in the construction of furnace plants in eastern Pennsylvania as elsewhere. The stone stack with the iron extension afterwards added to increase the height, gave way to the steel or iron shell supported on cast columns. The iron hot blast oven began to find its nemesis in the advent of the Whitwell and Cowper regenerative stoves, which were introduced in 1877. Dunbar furnace in western Pennsylvania was the first stack in the state to be thus equipped, and the Crane works in the Lehigh district followed shortly after. The ironmasters of the day had heated discussions of the merits of the new type of stoves as compared with the older method of heating the blast, but in the end, as well known, the regenerative stoves won out. Nevertheless, several furnaces in the Lehigh region still are operating iron pipe stoves.

In this same period, chemists were first employed at the eastern blast furnaces. B. F. Fackenthal Jr., then operating Durham furnace, took a special course in chemistry at Lafayette college, while about the same time Edgar S. Cook installed a laboratory at the Warwick furnace at Pottstown. From 1880 and through the present century there appeared many further changes in the types of construction. The stone cast-houses fashioned with great care, gradually gave way to those of light steel construction, and the broad inclined planes and wooden hoist towers were replaced with steel elevators or skipways. Later pig-casting machines, gas washers, improved boilers, more powerful blowing equipment and pumps were added, so that today there is little in common between the present blast furnace and its predecessor.

Engineers Superintend Remodeling

As the plants grew and rebuilding became more involved, trained engineers were called into consultation to redesign and superintend the remodeling. John Hartman, of Philadelphia, was one of the older engineers of this type. Frank C. Roberts, also of Philadelphia, was probably one of the first men to specialize in blast furnace construction, acting in a consulting capacity and also as a contractor.

While the development of the pig iron industry in Virginia is hardly germane to this article, yet it is interesting to follow the Pennsylvania iron men who directed their further energies in the Old Dominion state. The Firmstones, after their successes at Glendon, joined the Pardees in building Longdale, while over the mountain on the James river, Wilton

MODERN furnace of Colonial Iron Co., Riddlesburg, Pa., erected in 1911 on site of stone stacks built in 1869-70

MODERN furnaces at Hokendauqua, Pa., of Thomas Iron Co., which has been a leading eastern pig iron producer since 1864

COLEBROOK furnaces at Lebanon, typical of the construction of the furnaces built in that district

MODERN stack of Robesonia Iron Co., Robesonia, Pa., which with its predecessors, has been producing iron from Cornwall ore banks for 125 years

Cook, of Wrightsville, was operating Princess furnace. Samuel A. Crozer, a wealthy cotton manufacturer of Chester, established the plant at Roanoke bearing his name in 1882. The Radford-Crane Iron Co. erected a furnace in 1890 at Radford with Samuel Dixon, who was president of the Crane Iron Works, as president, and W. S. Pilling, now president of the Northern Iron Co., as secretary and treasurer. Both the Crozer and Radford furnaces now are the property of the Virginia Iron, Coal & Coke Co., which is the leading interest in the Virginia iron field today.

Knew Iron Business Thoroughly

All these establishments had their reverses peculiar to the Virginia district, but it remained for the Pulaski Iron Co. to become a success from the time the furnace was first blown in, February, 1888. A. J. Dull, of Harrisburg, was the first president, and associated with him were E. P. Borden, Abram S. Patterson, Charles L. Bailey, James T. Doran, John W. Eckman and F. J. Kemble, the president of the Norfolk & Western railway, all Pennsylvania men who knew the iron business thoroughly. All these men have passed away, but as mentioned previously, the present guiding spirit of the company is Horace L. Haldeman, of Marietta. The Alleghany Ore & Iron Co., operating furnaces at Iron Gate and Buena Vista, is controlled by the Lukens Steel Co., of Coatesville, a leading eastern producer of plate.

The iron industry developed an unusually sturdy type of men and it was not at all unusual in Pennsylvania to find the heritage of the industry handed down from father to son. Many of the iron manufacturers became leaders in the affairs of the state and nation. Ethelbert Watts, long in the consular service of the nation, and who died within the last few months, for many years was an officer of the old organization which operated Vesta furnace at Marietta. The father of Andrew Curtin, who was the governor of the commonwealth during the Civil war, was a pioneer in the iron business in Center county. The family of the present governor, William C. Sproul, has been in the iron business in Pennsylvania for several generations. His great-grandfather, Charles Sproul, was a forgewright and afterward became a forge owner on the smaller water powers in the Schuylkill valley. Charles Sproul's son, James, was quite an extensive manufacturer for the early days and up to his death in 1847 conducted large forges and bloomeries along the Octorara creek, and the charcoal blast furnace at Black Rock in Lancaster county. Mr. Sproul was one of the largest land owners in Lancaster and Chester counties and controlled much forest territory from which he made charcoal. His sons continued the business until the advent of the railroad and steam power caused a centralization of the ironworking in other communities. William H. Sproul, the governor's father, concluded his business career as an official of the Chester Rolling Mills, operating the blast furnace at Chester. Governor Sproul is president of the Lebanon Valley Iron & Steel Co., Lebanon, Pa., a large maker of iron mill products.

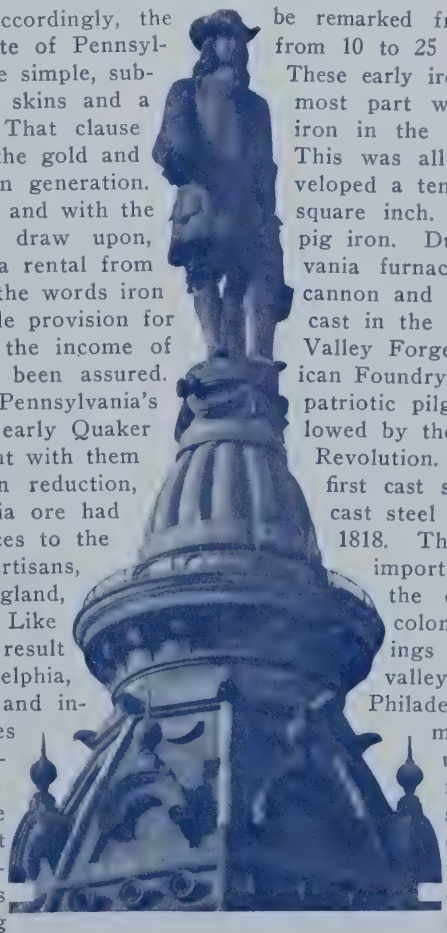
The old ironmaster of Pennsylvania has gone and with him the romantic side of the pig iron industry. The furnace plants which once were the center of their individual communities have been replaced by modern types. Instead of the old hillside stack with its wooden sheds and its mule and ox teams, draying in the ore and charcoal, we have the modern furnace almost outflanked by the towering stoves and stacks, while a minature railroad system is necessary to handle its daily needs of raw material and ship its product to market.

Many Old Plants Abandoned

There are but few men now in the trade who can bring to memory the roll call of euphonious names that once stood for busy furnace plants, such as Aurora, Augusta, Big Pond, Bloom, Cordelia, Caledonia, Coleraine, Conestoga, Duncannon, Donegal, Dauphin, Glamorgan, Glendon, Greenwood, Irondale, Johanna, Lackawanna, Mill Hall, Mount Laurel, Mount Hope, Montebello, Montour, Maranda, Maiden Creek, Norway, New Market, Pine Grove, Roaring Creek, Rock Hill, Swatara and Safe Harbor. Yet these and many others once supplied the foundries of Pennsylvania with their most important raw material.

The long list of abandoned plants serves to illustrate the changes wrought by time and by new methods. But the growing needs of the foundrymen of eastern Pennsylvania are well balanced by the greater pig iron outputs of today, concentrated in fewer furnaces and operated in an era of applied technical knowledge.

Floor of Cylinder Molds in the Baldwin Locomotive Works



Old Ironsides America's First Locomotive Made in Philadelphia

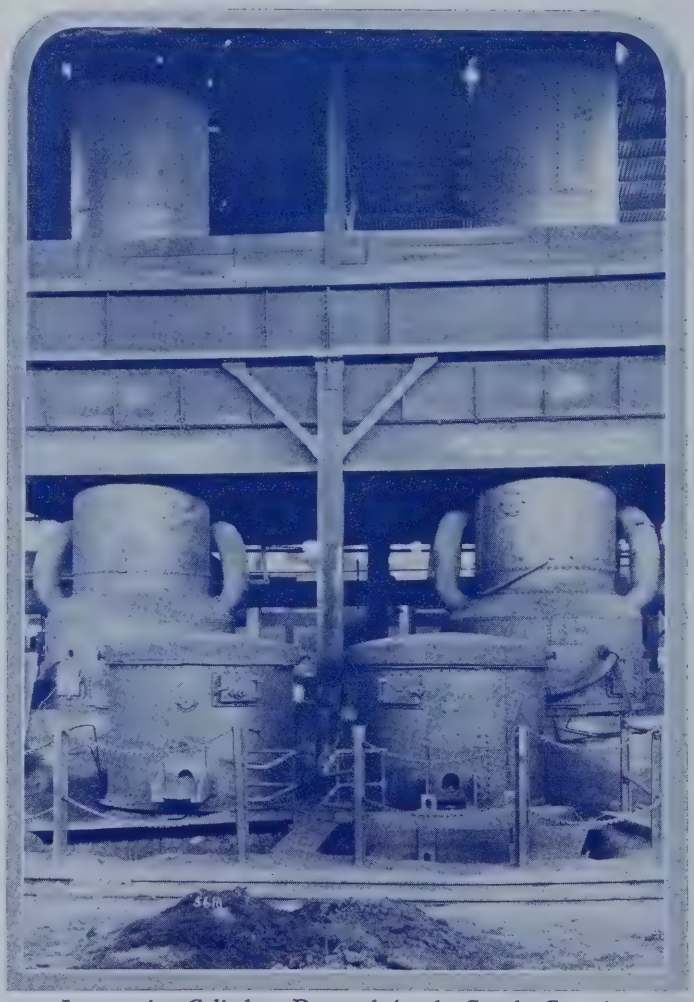
Philadelphia as a Foundry Center

BY D. M. AVEY

LOOKING down from the lofty tower of Philadelphia's city hall is an imposing statue of William Penn, the city's founder. This wonderful specimen of the art of ornamental casting stands 37 feet high, measured from the simple pedestal to the crown of the Quaker hat. Aside from its interest as an example of the foundry art, this figure bears an especial significance. The casting was produced in the plant of the Tacony Iron & Metal Co. under direction of Francis Schumann, the first president of the American Foundrymen's association, and was raised to its commanding eminence shortly before the first convention.

WHEN Charles II, England's most frivolous king, conveyed Pennsylvania to William Penn, he felt sure he had made a good bargain. He had rid himself of the importunities of an insistent Quaker who felt that even monarchs should pay their debts. Furthermore, the territory lying along the Delaware meant little to his royal imagination as the country was wild, the settlers were hardly worth taxing and the resources were extremely doubtful. Accordingly, the land, representing almost the entire state of Pennsylvania was vested in William Penn in fee simple, subject only to a quit-rent of two beaver skins and a fifth of all the gold and silver ore. That clause requiring the payment of a portion of the gold and silver ore is illuminating to the modern generation. Here was a king who in all his wisdom, and with the unbounded realms of imagination to draw upon, specifying only gold and silver ore as a rental from Pennsylvania. Now had he only added the words iron and coal, and had he made some suitable provision for collection through established agencies the income of at least one royal family would have been assured. Gold and silver had she none, but of Pennsylvania's iron—that again is another story. The early Quaker settlers who founded Philadelphia brought with them a knowledge of the processes of iron reduction, forging and casting. Native Pennsylvania ore had suggested forges and later small furnaces to the settlers. The news of these attracted artisans, workers in metal who came from England, Wales, Scotland, Germany and Sweden. Like attracts like in industrial lines. The result was most clearly demonstrated in Philadelphia, where a small industrial nucleus grew and increased until today a circle of 200 miles diameter, circumscribed about old Independence Hall as a center would embrace practically 40 per cent of the foundry business of America and almost 50 per cent of the hardware manufacturing of the world. In the early days Philadelphia throve along metal working lines in proportion even as it does today. The Schuykill and the Delaware offered wonderful facilities for transporting iron from the forges and furnaces further up-state. Originally the foundry industry was one and inseparable with the smelting of iron. In Swank's history of iron-making in Pennsylvania is recorded the fact that the first stoveplate cast in this country, inscribed 1763, was made at the Colebrookdale furnace. By remarkable coincidence the first English cast-iron pots, kettles and other hollow ware by the use of sand molds was produced at the original Colebrookdale furnace in Shropshire, shortly after 1709. In 1789 there were said to have been 14 furnaces in Pennsylvania. These were small, as may be remarked from the fact that they produced only from 10 to 25 tons of pig iron and castings a week.

These early iron works of Pennsylvania were for the most part within 40 miles of Philadelphia. Pig iron in the early days sold at about $15 a ton. This was all cold blast, charcoal iron which developed a tensile strength up to 40,000 pounds per square inch. Castings brought twice as much as pig iron. During the Revolutionary war, Pennsylvania furnaces contributed a large share of the cannon and round shot which in most cases were cast in the sand directly in front of the furnaces. Valley Forge, where many members of the American Foundrymen's association will no doubt make a patriotic pilgrimage during the convention, is hallowed by the memory of the darkest hours of the Revolution. In this vicinity some of America's first cast steel is said to have been made. Here cast steel for use in saws was made as early as 1818. The clay for making the crucibles was imported from England. Philadelphia formed the center for the greater part of the colonial iron business. Bar iron and castings which were made in the Schuykill valley were transported down by boat to Philadelphia. The city itself furnished a fair market for the castings which were in use in pre-Revolutionary days. The field was extremely limited. The simplest of kettles and hollow-ware embraced the greater part of what would be considered castings for domestic use. Municipal castings also were unknown. The early waterworks system of Philadelphia was primitive and called for little from the foundry. All the mains were logs, bored through the center and joined by a simple form of flanged connection. These connections were the only iron fittings used. Some of these, which were used in the late years



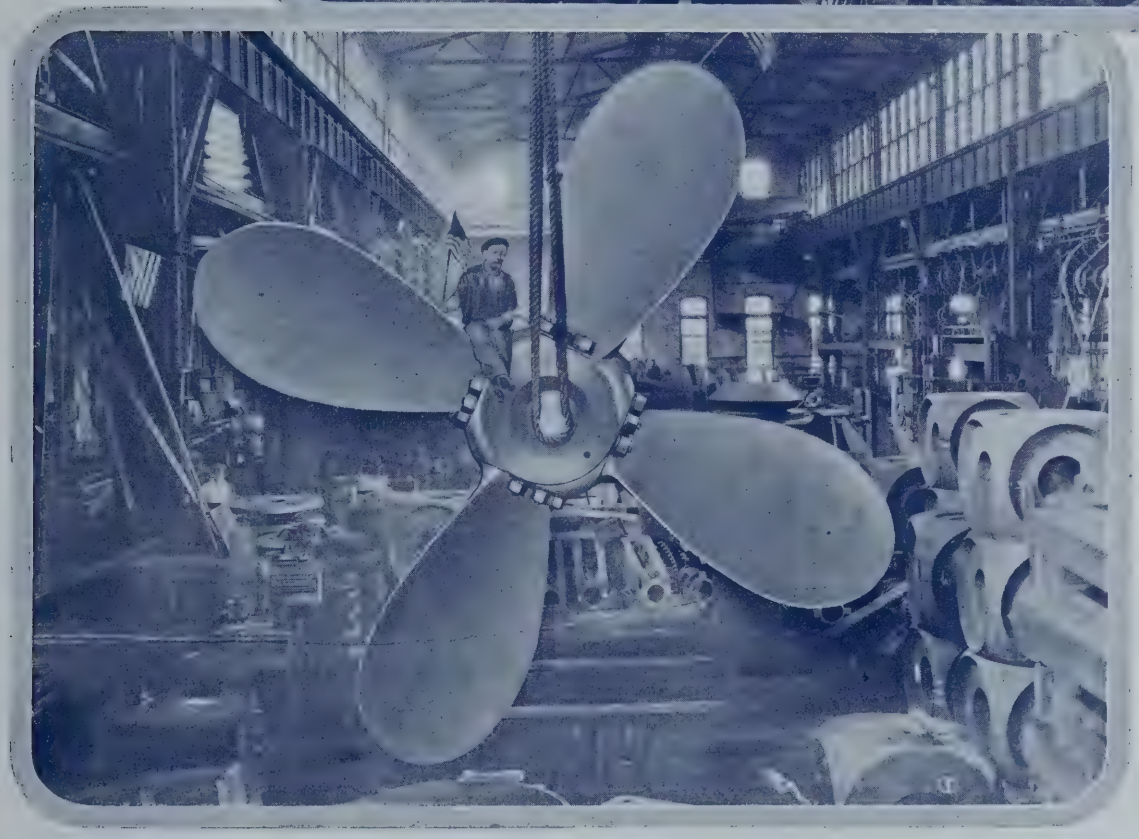
of the 18th century may be seen today in the Franklin institute located in Philadelphia. The first mention of cast iron pipe used in the city refers to some laid in 1817. This was made in England. About this time, R. D. Wood & Co., Philadelphia, made some of the first cast pipe which was produced in this country. This was only 2 or 3 inches in diameter, and was molded horizontally in 9-foot lengths. Some of the earliest examples of pipe founding have been removed during late years and have been found to be in a remarkable state of preservation. It is interesting to note that the firm of R. D. Wood & Co., which was established soon after the Revolutionary war and which is said to have produced some of the first pipe molded in America still is an active concern, producing cast iron pipe and a varied line of equipment. The offices of this company are in Philadelphia and the main foundry is at Florence, N. J. The present executive of this company is a son of the founder of the institution, who dates back to the early eighties. Careless thought has attributed to the city of Philadelphia a somnolent character, slow, plodding and at times somewhat behind the procession in ideas. It is only necessary to point to a few concrete examples to refute this characterization. Franklin, statesman, philosopher, and inventive genius dominated with his personality the last half of the 18th century and his mastery alone gave to Philadelphia the lead in political, social and scientific thought during that period. Even the foundry industry bears the touch of Franklin's master hand. He published in 1744 a pamphlet describing a newly invented stove or "Pennsylvania fireplace." This was in effect a cast covering for the front of a fireplace, without oven or chimney. The first stoves made in America are thought to have been cast by Christopher Sower of Germantown, which is located only a short ride from the city. Philadelphia's ascribed sluggishness and inertia again is challenged by a name which always is linked with that of the Quaker City, and is known through all the lands where steel rails have shortened time and space. Matthias W. Baldwin was a Philadelphia jeweler. Had the alleged lethargy of the community possessed him, his hall-mark might have adorned a few odd pieces of plate preserved in vaults of some of Philadelphia's old families and hundreds of "Pershing" locomotives might have been built in Sheffield, Newcastle or in Birmingham. Mr. Baldwin formed a partnership in 1825 with David Mason, a machinist, to manufacture bookbinders' tools and cylinders for calico printing. An engine which was purchased to operate some machinery in the factory proved unsatisfactory and as engines were few and similar in design in those days, Mr. Baldwin designed and constructed one on his own ideas. This led to the manufacture of stationary engines and directed Mr. Baldwin's attention to the practicability of steam as a propelling power for traction purposes. In 1830 a few British-made locomotives of a primitive type had been imported, and one which was only partially successful had been built previously by the West Point Foundry, New York. About this time, Franklin Peale, director of the Philadelphia Museum requested Mr. Baldwin to build a miniature locomotive for exhibition purposes. Basing his design on published descriptions of locomotives that had taken part in the Rainhill competition of steam-propelled vehicles held in England, Mr. Baldwin, in April, 1831, completed a small locomotive which ran about a circular wooden track in the museum. This miniature was so successful that in the same year Mr. Baldwin received an order for a locomotive to operate upon the Philadelphia, Germantown and Norristown railroad, a six-mile trunk line, operating horse-drawn cars for passenger traffic. Mr. Baldwin, in company with Mr. Peale inspected the loose parts of a locomotive which had been sent from England. With this scant basis for design, work was started in Mr. Baldwin's small but efficient machine shop. The difficulties of this undertaking may be appreciated when one visits today the modern plants of the Baldwin Locomotive Works

Huge Locomotives Are Assembled Progressively

Cutting the Riser From a Large Bronze Propeller

Locomotive Cylinders Demand Ample Cupola Capacity

in Philadelphia, or at Eddystone, Pa. No machine tools were at hand for producing and machining the parts. The foundry operations were practically without precedent. Cylinders were bored with a chisel fixed in a block of wood and turned by hand. The wheels were made with heavy cast-iron hubs, wood spokes and rims and wrought-iron tires.



The entire locomotive when completed weighed about five tons. In the trial trip made Nov. 23, 1832, a speed of 28 miles per hour was attained, and it was predicted that a load of 30 tons could be drawn at an average speed of 40 miles per hour on a level road. This locomotive, Old Ironsides, continued for some time a great attraction for the traveler who sought a new sensation. It occupied the place now being taken by the indigent air-plane taken about from place to place to afford rural dwellers a short trial flight.

The Baldwin interests passed through numerous viscissitudes during the early years of locomotive construction, but steadily maintained a place in the lead of advanced construction. The Civil War found the company prepared to aid to the fullest extent in supplying locomotives for government service. Similarly the outbreak of the Great War brought burdens which were handled admirably.

As early as November, 1914, 30 locomotives were ordered for Russia. This was only the first of a series of orders from the allies, and finally from the United States government. In the summer of 1917 the initial order of 150 standard gage locomotives for the American Expeditionary Forces was placed. The first of these was completed on Aug. 10 and the last on Oct. 1. Orders which followed rapidly called for large numbers of similar locomotives, popularly known as "Pershing" locomotives, which were shipped completely assembled with the exception of smoke-stacks, cabs and a few minor details. At the time of the armistice the program of the company called for the completion of 300 engines of this type per month. This was in addition to special-type steam and gasoline locomotives, some of which

The Size and Weight of Ship Castings Demand Great Capacity for Pit and Floor Molding Operations

The First Propeller Delivered to the Hog Island Shipyard Weighed 34,000 Pounds and Was 18½ feet in Diameter

carried steam reservoirs filled from a central boiler. The latter were for use in the immediate vicinity of explosives, where no fire could be permitted. The different types of locomotives which were constructed for all the belligerent nations during the war included the following:

Broad gage steam locomotives	3246
Narrow gage steam locomotives	1146
Broad gage gasoline locomotives	20
Narrow gage gas'l'n locomotives	1139
Total	5551

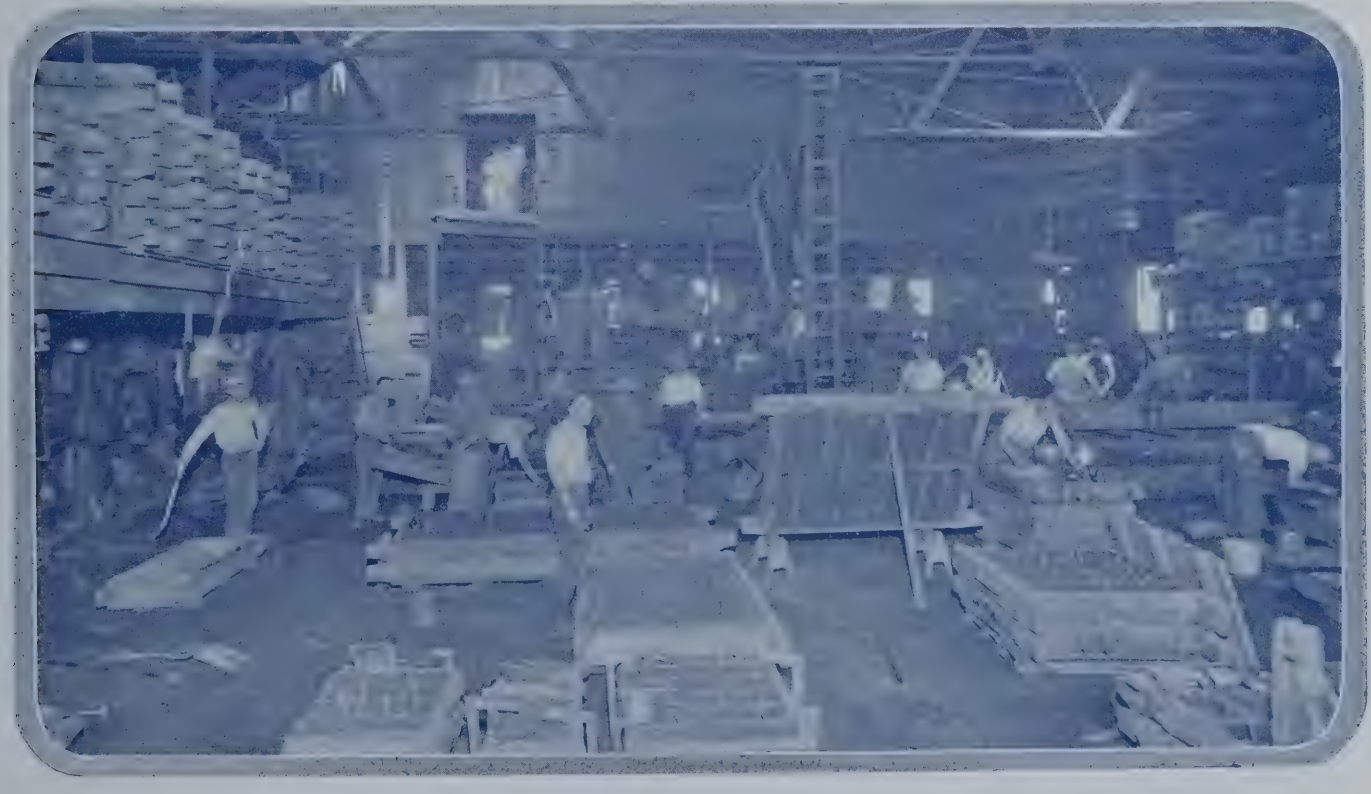
In addition to this work which was directly in line with the company's facilities over six million shells of various sizes were manufactured by the Eddystone Ammunition Corp., and the Eddystone Munitions Co., subsidiaries of the Baldwin Works. A very important undertaking which was handled with credit to the Baldwin company was the construction of 11 railway gun mounts for the 14-inch navy type gun. This super-gun which was used with deadly effect during the closing months of the war, has been fully described previously in THE IRON TRADE REVIEW. The aggregate of war work handled by the Baldwin works, the associated companies mentioned and the Standard Steel Works Co., another affiliated interest, totaled over $250,000,000.

The foundry capacity necessary for this great establishment has kept pace with the growth of the manufacturing plant. During 1906 a tract of 184 acres was purchased at Eddystone, Pa., about 12 miles from Philadelphia. Here extensive foundries and blacksmith shops were erected. Since 1907 extensive additions to this plant have been erected from time to time. These include further foundry facilities, pattern shops, pattern storage building and erecting shops. All gray iron, malleable and brass castings, are produced in the company's own foundries. All parts of locomotives with the exception of boiler and tank plates, chilled wheels, boiler tubes, and special patented appliances are made in the works of the Baldwin company from raw materials.

The growth of railway transportation did much to bring Philadelphia to the front as a manufacturing city. It also did much to establish its precedence as a foundry center. The trackless pathways of the seven seas, also have brought into being establishments which rival even the Baldwin plant. The city is ideally situated for a seaport. The broad Delaware and the Schuylkill furnish an irregular water front of almost 75 miles, where some 250 ships can be berthed at the same time. Thus natural facilities predestined Philadelphia, the second seaport of the United States, as a shipbuilding center. Hog Island only a short distance from the city is too well known to

Jobbing Shops, Stove and Furnace Foundries and Machinery Plants Contribute to the City's Foundry Supremacy

This 6-inch Cast Iron Water Pipe Was Laid in 1827 and Removed in 1915 to Provide a Larger Main



need more than mention. The League Island navy yard at the lower end of the city is particularly interesting to those engaged in the foundry industry through the recent completion of a $1,500,000 casting plant equipped to handle practically any class of work required for the vessels of the navy. This shop is equipped wih four cupolas capable of melting 71 tons of metal per hour in addition to a 3-ton electric furnace.

Along the Delaware is one of the oldest established shipyards in the country. This is the William Cramp & Sons Ship & Engine Building Co. William Cramp commenced building ships in 1830, almost at the same time when Matthias W. Baldwin turned from jewelry to locomotives. The Cramp company was incorporated in 1872. The first man-o-war built in this plant was the New Ironsides, launched in 1862. From time to time, since that date, this yard has contributed its services to the government in the construction of fighting ships, and several foreign battleships were built previous to 1914. The Cramp yard has constructed over 400 vessels since its founding, and from an early date the gray iron, steel and nonferrous metal castings required have been produced in plants operated by the Cramp interests. The foundries of this company have furnished as high as 3,000,000 pounds of iron, 2,000,000 pounds of steel and 1,000,000 pounds of bronze castings per month for use in vessels under construction in its own or other shipyards.

The interdependence of various industries is illustrated by a condition governing in Philadelphia. William Sellers & Co., Inc., is one of the largest manufacturers in America of machine tools for locomotive and railway equipment construction and for shipyard use. It specializes in heavy horizontal boring machines for locomotive cylinders, car wheel boring

Much of the Equipment Used in the Quaker City Foundries is Supplied by Philadelphia Manufacturers

Some of the Oldest Jobbing Shops in Philadelphia Still Are in Existence and Continue to be Actively Engaged

and turning mills, plate and boiler drills, bending machines, hammers, lathes, and slotting machines for locomotive frames. This company is one of the pioneers in metalworking in Philadelphia, and is particularly interesting from its large and splendidly equipped foundries.

The present firm was started in Philadelphia in 1848 by Messrs. Bancroft and William Sellers. In 1853 the firm erected machine shops, forge shops, brass and iron foundries and pattern shops in a number of buildings which still are occupied by the company. The old foundry with its allied shops occupied about 8600 square feet. The death of Mr. Bancroft in 1855 resulted in William Sellers and John Sellers Jr., assuming control of the business. The firm built a new foundry to accommodate its growing requirements in 1883. This has been extended until now the space occupied by the various casting departments is over 57,000 square feet.

The foresight of the designers of the foundry built at that early date is attested by the fact that it still is in use, and the arrangement and equipment provided are regarded as thoroughly efficient for the class of work handled. The foundry built in 1883 originally was provided with power and hand jib cranes which were superseded in 1885 by overhead power traveling cranes. These were indeed remarkable for their day, as previous to this time the slow-speed cranes available had been mere hoisting machines.

Early Molding Machines Used

Molding machines were used in the Sellers' foundry as early as 1860-61, and since that time the development of both hydraulic and pneumatic machines has been followed closely. The Sellers foundries at present do almost no outside work as the company's own requirements utilize over 8,600,000 pounds of castings annually.

So far only those foundries which serve large manufacturing establishments have been considered. These though larger individually constitute only a small portion of the foundry resources of Philadelphia and vicinity. The city leads the world in the production of hardware, including springs, locks, plumbing supplies, mechanics' and household tools. It produces over $40,000,000 worth of general hardware annually, and of this amount exports practically 40 per cent of all such commodities sent out of this country.

An old established house making general hardware, ship chandlery, fittings and jobbing castings is the Thomas Devlin Mfg. Co., headed by Thomas Devlin, who for years has been the president of the Philadelphia Foundrymen's association and was one of the founders of the national body. This company was started in 1865 immediately after the close of the Civil War. Hardware and meat choppers which were just invented formed the main products of the original company.

In 1870 Mr. Devlin became a member of the firm which was known as Carr, Crawley & Devlin. Later Mr. Devlin and Louis J. McGrath started in the malleable fittings business, and in 1880 a new plant was constructed at another location in Philadelphia. In 1902 the Thomas Devlin Mfg. Co. was incorporated and a large plant was built at Burlington, N. J., where a full line of malleable fittings now are manufactured. The two Philadelphia plants still forming part of the Devlin company make various general hardware, meat choppers, lard presses, hot air registers, etc.

When the foundrymen gathered in Philadelphia in 1896 they were advised to visit the stove foundries of the Abram Cox Stove Co., "presided over by A. C. Mott," who was one of those who founded the American Foundrymen's association. This plant still continues a point of special interest as one of the large stove factories of the country. The company was established over 72 years ago. Two foundries are operated, one in Lansdale, Pa., and the other, the original plant in Philadelphia. Every known apparatus for heating or cooking with coal or gas is made at these two factories.

A distinctive and highly specialized class of foundry work is represented in the plant of the American Manganese Bronze Co., located in Holmesburg, a suburb of Philadelphia. This company makes castings, forgings, ingots, rods and sheets of bronze. It specializes in marine propeller wheels, but the varied demands of industry call for the production of heavy hydraulic castings, turbine runners and casings, valves, and gears at various times.

Jobbing foundries handling brass, steel and iron are liberally represented in the city. A characteristic foundry of the latter class is the Girard Iron Works which has been in continuous operation since 1864. This plant produces from 10 to 12 tons per day of medium and light weight castings, particularly high grade machinery castings. The Aetna Foundry which operates the plant formerly owned by the Tioga Foundry Co. is a similar plant which produces about 20 tons per day of castings weighing from a few pounds up to 10 tons.

The Enterprise Mfg. Co. which makes hardware specialties, particularly food choppers, has an interesting foundry which was established over 50 years ago. This plant produces about 25 to 35 tons of small castings per day. These all are utilized by the company of which the foundry is a part.

The extensive textile industry of the eastern states supports a large foundry capacity in Philadelphia. An example of this classification is the Fletcher Works, successors to Schaum & Uhlinger. This company manufactures looms and textile machinery, and centrifugal machines for extracting liquids from raw or finished fabrics, hides, pulp, chemical salts, ore, sand and chemicals and for reclaiming paint, oil and grease from turnings, used containers, rags and waste.

While probably not so well represented in the steel casting branches the Philadelphia community possesses some notable steel foundries. The Midvale Steel & Ordnance Co. which was particularly active during the war produces in normal times over 2200 tons of acid and 6500 tons of basic open-hearth steel castings annually in addition to 9000 tons of iron castings used within the plant itself.

A highly specialized branch of the industry is represented by the Ajax Metal Co. which was established in 1880. This company makes railway and machinery bearings and bearing metals. This was the first company excepting the Cramp interest to enter upon the commercial production of ingot manganese bronze. A complete plant for the recovery and refining of by-products, known as copper-bearing material is operated and recently a new plant has been added to manufacture a type of electric furnace which has been used successfully in the company's own foundries.

Obviously it is impossible to enumerate all the 133 foundries of Philadelphia proper. The city ranks third in the number of casting plants and probably excels all other American cities in the tonnage of castings produced. Furthermore, it is the hub of a great industrial district including other important foundry centers such as Camden, Chester, Burlington, Lansdale and Pottstown. Foundrymen who visit the Inter-Allied Foundrymen's Convention and Exhibition will have an opportunity to visit and inspect some of the most modern and efficient molding and casting plants in the world.

CONNERSVILLE VALVELESS ROTARY PUMPS

Are extremely simple, rugged and efficient.

The above illustrates internal construction showing the two symmetrical rotating parts which are called impellers.

These do not come in contact with the case or with each other but are separated by a small clearance.

The pump discharges six times per revolution resulting in a smooth flow with the minimum of shock.

Heavy steel shafts are pressed and keyed into the impellers and rest in bearings of generous size which are lined with genuine babbitt.

These pumps are suitable for handling nearly all liquids or for maintaining either high or low vacuums.

Quotation and descriptive matter on request.

Hyatt Roller Bearings for

MEANS HYATT ROLLER BEARINGS

The handling of material to and from machines and from department to department, during the process of manufacture, is one of the most important items entering into the cost of production. The economy and labor saving value of I-beam trolleys for this purpose is universally recognized.

In order to secure the most economical results from such a trolley system, it is essential that the trolleys be easy starting and easy running, thoroughly dependable and capable of years of satisfactory operation.

That is why HYATT ROLLER BEARINGS are a logical and necessary part of every durable, dependable, quality trolley.

Hyatt Roller Bearings are rugged, practical bearings that eliminate over 50% of the dragging friction of plain bearings. They assure an easy starting and easy running trolley. These modern bearings require lubrication only three or four times a year. Their durability is such that they operate for years with an absolute minimum of attention.

In other words, Hyatt Roller Bearings have all the qualities that are essential for modern, efficient, economical trolley operation—they are easy running, durable, self lubricating, dependable.

It will pay you to specify modern, economical trolleys—those equipped with Hyatt Roller Bearings.

PRODUCER ASECO CONSUMER

Tell the World

In an effort to capitalize America's foreign trade expansion, many schemes are being devised and foisted on our manufacturers. The mails are deluged with appeals from publishers of export media, good, bad and indifferent, offering ostensibly to solve what they are pleased to term your "problem".

The methods employed by American manufacturers in speeding up business at home can be extended in developing international trade.

Success will hinge upon working out a sales policy based largely on an accurate knowledge of conditions in the foreign market and of the products to be marketed.

Publicity is essential in telling your story but it must be followed up closely—the man on the job—the heart to heart talk with the representative who knows his line and knows also his customers requirements, are necessary to gain your objective.

HERE IS WHERE ASECO CAN BE OF SERVICE TO YOU. Our own exclusive representatives are stationed at every trade center. They are familiar not only with the requirements of their individual market but with American products and standards as well.

And this is but the first step of ASECO SERVICE in telling your story to the world—linking producer and consumer.

PARCO

SERVICE Simplifies Foreign Trade

Reaching the markets of the world is a problem of great study and expense to the American Manufacturer who desires to internationalize the sale of his product. It means picking men, training them, and then years of "breaking-in" in the field.

Parco Service extends to you the skill and knowledge of trained Americans, experienced in the handling of American products in foreign lands, and thoroughly conversant with the foreign methods of doing business.

Reversing Furnaces-

To give most efficient results, valves for reversing furnaces of any type must

(1) Prevent the loss of draft. (2) Increase life of the checkers. (3) Maintain proper ratio between air and gas to checkers. (4) Prevent loss of gas. (5) Regulate the proper amount of air and gas to each end of the furnace. (6) Make Sunday shutdowns possible without the loss of gas.

All these essentials, and more, are assured when you use Knox patented Water Cooled Reversing Valves.

Our engineers will be pleased to study your problem—call them in for consultation.

Write for further data.

PRODUCTION

Is Your Production Failing to Meet Demand?

If the demand for your products exceeds the capacity of your present plant and you wish to increase production we will do for you what we are doing for many manufacturers in a similar situation.

First we will make an engineering study of your plant and make recommendations for extensions if such are required. We will then design and construct the additions.

The service which we can perform is thus complete, extending from the preliminary study to the last brushful of paint on the finished work.

"Work Done"—shortly to be issued—pictures some of the plants we have extended, as well as many new plants which we have designed and built complete. If you contemplate plant construction of any kind we shall be glad to send a copy of this book.

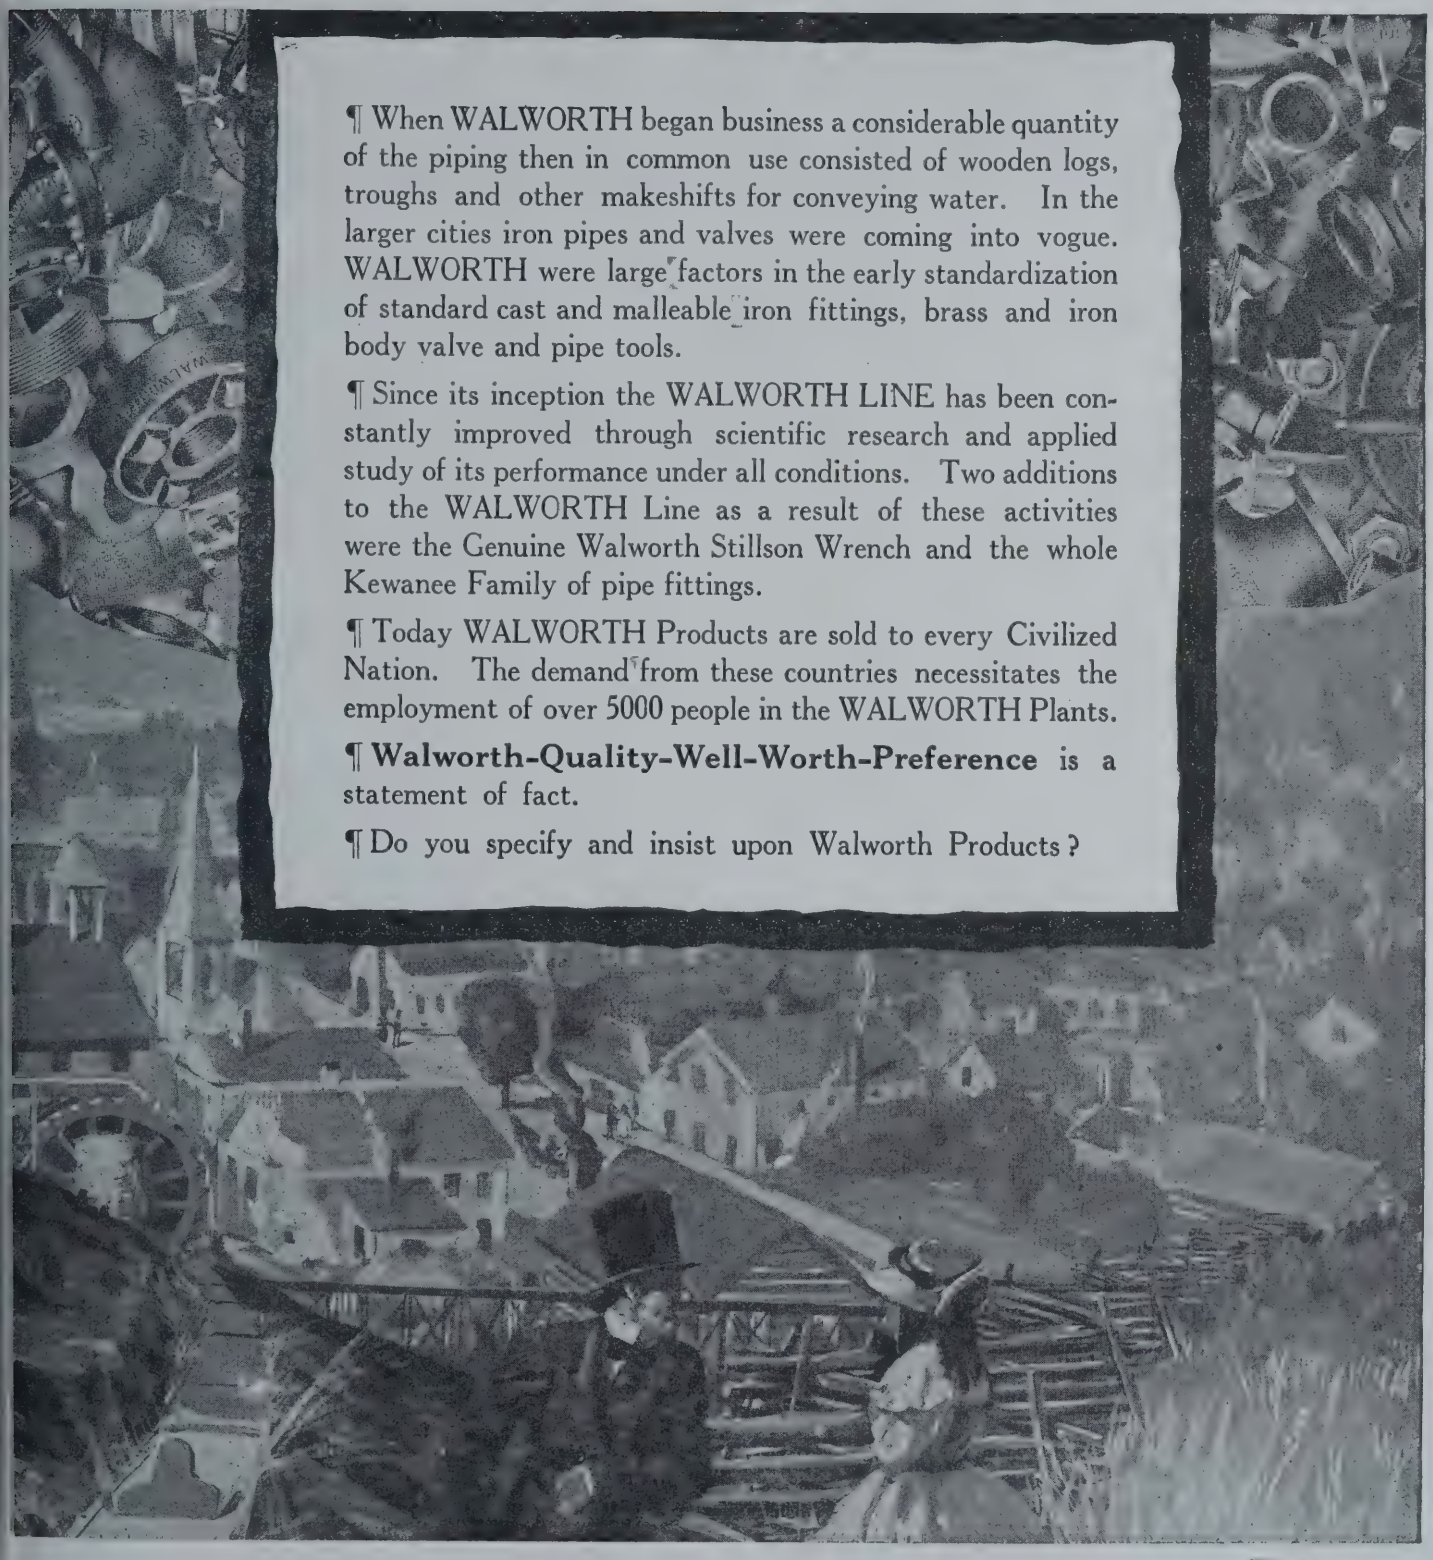
Office: Chicago, Ill. Works: Kewanee, Ill.

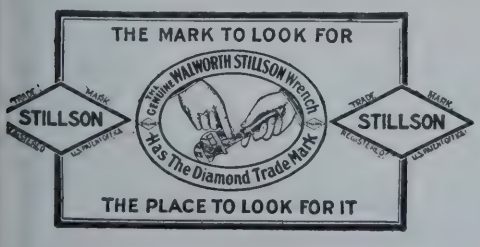
Sales Offices: San Francisco, Johannesburg, Havana, Mexico City, Buenos Aires, Santiago, Sydney, London, Paris, Sao Paulo

Say you saw it in THE IRON TRADE REVIEW

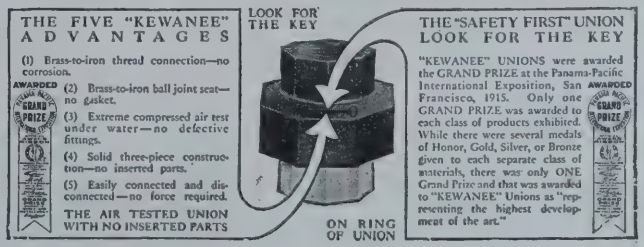
Business in 1842—



¶ When WALWORTH began business a considerable quantity of the piping then in common use consisted of wooden logs, troughs and other makeshifts for conveying water. In the larger cities iron pipes and valves were coming into vogue. WALWORTH were large factors in the early standardization of standard cast and malleable iron fittings, brass and iron body valve and pipe tools.



¶ Since its inception the WALWORTH LINE has been constantly improved through scientific research and applied study of its performance under all conditions. Two additions to the WALWORTH Line as a result of these activities were the Genuine Walworth Stillson Wrench and the whole Kewanee Family of pipe fittings.



¶ Today WALWORTH Products are sold to every Civilized Nation. The demand from these countries necessitates the employment of over 5000 people in the WALWORTH Plants.

¶ **Walworth-Quality-Well-Worth-Preference** is a statement of fact.

¶ Do you specify and insist upon Walworth Products?

"SHELBY" Seamless Steel Tubing for Mechanical Purposes

Group of Sizes and Shapes of "SHELBY" Seamless Steel Tubing

"SHELBY" Seamless Steel Tubing for Mechanical Purposes is made in a wide range of sizes and thicknesses. The sizes run from ¼ inch to 20 inches O. D., and the thicknesses, depending on the diameter, from No. 20 gauge to 1½-inch wall.

¶ Several different grades of steel are used which are individually treated to various degrees of annealing. For work requiring the greatest stiffness and rigidity, it is shipped *unannealed;* for all ordinary requirements it is *finish annealed,* just sufficiently to remove the cold drawing strains; for large radii bends, small flanges and light deformations, it is furnished *medium annealed;* and for very short radii bends or exceptional manipulations, it is made very soft, either in retorts or in the open furnace.

¶ To insure smoothness and accuracy "SHELBY" Seamless Steel Tubing for Mechanical Purposes receives a number of passes through the dies to finish to size.

¶ It is made in square, rectangular, oval and other special sections, a few of which are shown above.

Little Giant Air Drills are more than drills

Having drilled out the stud-bolt holes in the casting pictured above, this "Little Giant" is now busy tapping them. Setting the stud-bolts will be its next job; and every operation will be characterized by the same speed-economy factors. Rugged, long-wearing construction, ease of control and economy of air consumption, are leading features in the performance of Little Giant Air Drills. For quantity production they are a power indeed. In many shops today they are being put to uses entirely new, their desirable qualities being introduced into step after step of the production processes. New applications for air drills are being discovered daily—and thousands of "Little Giants" in use throughout the world form an almost universally recognized standard in air drill construction and design.

Little Giant Air Drills are built in a wide variety of sizes and types to meet every requirement of drilling, reaming, tapping, screw setting, nut and bolt tightening, etc. Write for Bulletin.

FOR TOUGH JOBS

The machining of rolling mill rolls is a mighty tough job and a test under which many highly advertised steels have fallen down completely.

Electrite-Uranium High Speed Steel has been tested out on the hardest kind of chilled rolls, 50, 60 and 70 point carbon with the greatest success. It has proved to be in many comparative tests, from twenty to fifty per cent higher in efficiency than the usual run of high speed steels, and its capabilities are only limited by the capacity of the lathe.

TITANIUM TALKS

No. 71

CLEAN STEEL IS IMPORTANT FOR TIN-PLATE

A majority of the troubles encountered by canners in the lasting qualities of their cans, and by can manufacturers in the working properties of tin-plate, may be blamed on dirty steel. In the accompanying illustrations, for instance, cross-sections are shown of can seams, or the sealed joints between the bottoms and sides of ordinary tin-cans. The tightness of the can is dependent on the perfection of this rather complicated folded joint, and in both cases illustrated (magnification 30 diameters) one of the sheets is seen to have cracked. A close examination will show an abundance of minute dark inclusions in the cracked sheets, while the sheets that bent without cracking are pratically free from impurities.

Here then is a clear comparison of the working properties of dirty steel and clean steel, and the need for clean metal in tin-plate could hardly be more plainly shown.

TITANIUM TALKS

No. 71

The nature of the inclusions shown as specks in the illustrations referred to above can be determined by magnification of the samples to 200 diameters. View taken near one of the breaks, and one in a straight part of the tin-plate, are shown herewith, and the appearance indicates without doubt that alumina was the cause of this trouble.

Something must have gone wrong with this heat of steel when it was made, and the ingots probably did not act properly when they solidified, so aluminum was added as a corrective. Naturally dirty steel resulted, and after all the expense of rolling, tinning and can manufacture, cracking of the sheets brought only loss and dissatisfaction. To avoid troubles of this kind, why not make good clean steel with the aid of FERRO CARBON-TITANIUM, and remove the temptation to use aluminum or other dirt producing additions?

1. 90% of our product is Special Analysis and Alloy Steel.

2. We concentrate on Quality - not tonnage.

3. All of our Steel is melted in electric or small Open Hearth furnaces. An average Open Hearth heat will make 25 or 30 tons of finished product.

4. The steel is bottom poured into our special patented hot top Bradford molds for the purpose of overcoming piping and segregation.

5. Ingots are reduced to billets on a Universal Mill—not on a Blooming Mill. Reduction is gradual so as to eliminate rupturing or tearing the steel. For example, 34 passes are required to roll a 4" sq. billet from one of our ingots.

6. Billets are carefully inspected, pickled and chipped, after which they are re-rolled into bars.

7. The finished product again passes through another very rigid inspection before shipment is made.

8. Because of the fact that so much of our material is special analysis and alloy steel, we purchase none but the best grade of pig iron, scrap, raw materials and alloys.

We will be glad to quote you on your requirements on quality steels

IRVING SUBWAY (PATENTED) TRADE MARK REG. THE FIREPROOF VENTILATING FLOORING

IRVING SAFSTEP (PATENTED) TRADE MARK REG U S PAT. OFF.
ABSOLUTELY NON-SLIPPING ALWAYS

A Comfortable Flooring

That's the word most often applied to **Irving Subway**, in the plants where it is used. The moment you step from any other floor, onto a floor of **Irving Subway,** you experience a feeling of comfort and safety and relief which cannot be described. Can you doubt for a moment that this feeling—this mental and muscular relief—reacts to your advantage in a higher efficiency in your men and a tuning-up of your operations? And this is only one of the advantages of **Irving Subway.** Read about others, in Catalog 2A32, sent on request.

STAINLESS STEEL

Here is a steel that will make a reputation for your products, or add to the prestige of a reputation that has already been made.

Stain less

STAINLESS STEEL DOES NOT RUST

It preserves fine tools, etc., indefinitely from that steel destroying disease, *Erosion.* It is immune from erosion. We are anxious to send you complete details regarding Stainless Steel. Why not write us at once?

For
CUTLERY

Our Brands:

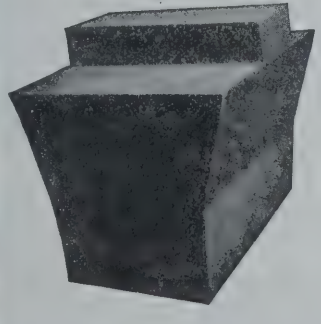
REFINED
for ordinary users.

VULCAN
for special purposes.

Vulcan Special
for engine bolts.

VULCAN XX
for locomotive stay bolts.

To wholly preserve the high standard of quality that has always been recognized in ***Vulcan Iron*** we still adhere to the old-fashioned method of puddling.



Vulcan Iron is made by the ***quality*** process, not the ***quantity*** process.

LOCKHART IRON & STEEL CO.
PITTSBURGH, PA.

ADAMITE

PATENTED

"ADAMITE" Hammer Dies for Hard and Heavy Forgings

7 times ordinary service

This "ADAMITE" Die, used on a 2500-lb. hammer, forging high-speed steel, gave more than seven times the life of any other die—just another "Record of Performance". We recommend "ADAMITE" Dies for finishing and welding work.

How much can we save you?

Pittsburgh Iron & Steel Foundries Co.

Executive Offices, PITTSBURGH Foundries, MIDLAND, PA.

Looking Back

Pretty soon we shall be looking back at 1919—and ahead at 1920. Some folks may have misgivings. We have none. We are quite firmly of the opinion that the policy of a square deal for every square man will work, and that any other policy in the long run—simply won't.

"Why should I purchase Gier parts when the cast or pressed parts I am now using are perfectly satisfactory."

Because, there is always the possibility of discovering "something better" and of realizing advantages in your production that you cannot now imagine, we answer. Gier parts are constantly creating precedents in the use of pressed metal.

Let us confer with you on the subject — send us blue prints for free analysis and report.

"BLISS"-MADE STAMPINGS

In line with our policy of bringing the users and the producers of metal stampings together, we wish to call attention to some open capacity for blanking, punching and stamping work in small and intermediate sizes and in considerable quantities.

Among others we have in mind, particularly a concern with rather a large and complete equipment of "BLISS" Presses and able to handle immediate orders for this class of work. This firm can design and make dies for its customers and can also take care of orders requiring drop-forging and light welding.

Write us, enclosing sketch and description of the articles or parts you wish made and if this firm can handle your work we will put you in touch with them. If not, there is someone else who can. We will tell you who it is.

AMERICAN STEEL COMPANY

Park Building PITTSBURGH, PA.

"Up springs hope anew!"

As the manufacturer remarked when after several unsuccessful attempts to get the right quality springs he ordered——

RAYMOND SPRINGS

We can please *you* or any other manufacturer in Spring requirements.

Our business is that of the manufacturer of Springs and *Springs alone.* We think Springs, we talk springs and *we live springs.*

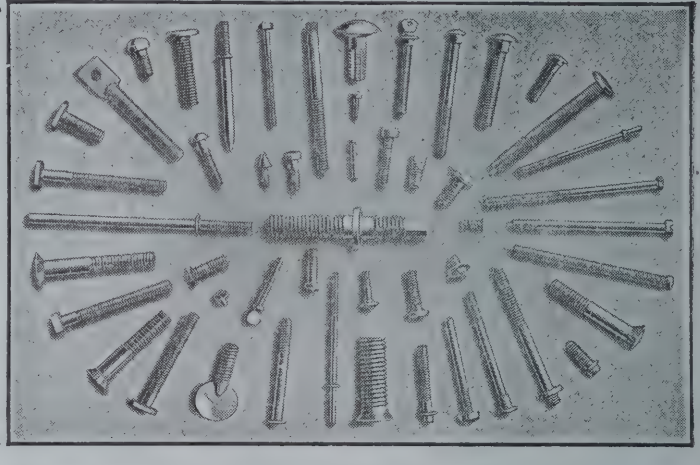
We are strictly Spring specialists.

Give us an idea of what you need and we are sure we will be able to satisfy you.

We manufacture Springs from Carbon and Vanadium Steels, Brass, Phosphor Bronze, German Silver and Music Wire.

We finish them in Japan, nickel, copper, galvanized, oxidized or plain.

Raymond Mfg. Co. Ltd. Center St. **Corry, Pa.**



Screws—Rivets—Studs

Sink Bolts, Closet Screws, Complete Line of Machine Screws Boxed for the Hardware Trade. Threaded Wires

Each article illustrated was made for discriminating customers who demand something better than the usual kind. Our process enables us to make many articles that are now made on screw machines. We make them **just as good, much quicker and MUCH cheaper.**

Estimates gladly furnished *State quantity and submit samples*

Catalog mailed upon request

Unless your work can be done best by welding, we would not recommend a

THOMSON SPOT WELDER

We want satisfied users of **Thomson Spot Welders.** If your particular work can not be done better and quicker by the **Thomson Process** our engineers will frankly tell you so.

Put your problem up to them.

Ask for Bulletin SA-4.

Some manufacturers, after 25 years of steady service are still using

THOMSON BUTT WELDERS

These welders endure hard, continuous service indefinitely. They operate without smoke, glare, dirt or danger and with very low current consumption.

Made in a variety of sizes and styles for most every welding requirement.

Write for Bulletins BA-4 and BB-4.

Demand Ferry Products

Ferry offers you:

1. A complete line of screw machine products, such as cap screws, set screws, milled studs, spring bolts, king bolts, tie rod bolts and connecting rod bolts.
2. The thirty years experience of Mr. Ferry in solving the problems of the manufacture of screw machine products.
3. Twelve years of experience that is back of the Ferry Plant in making screw machine products. Ferry Products are no experiment.
4. The Ferry Patented Process of manufacture—a process that guarantees quality and workmanship, including all parts completely machined and properly heat treated.
5. A complete plant specializing in the manufacture of screws and special bolts made by the Ferry Patented Process.
6. A heat-treating department that is equipped with the most modern machinery and tools known to the art, insuring you proper treatment of your product.
7. Carbon or alloy steels either machine finished or hardened and ground in accordance with your specifications.
8. An organization that is trained to micrometer readings only—thus producing a product of exceedingly close limits and which conforms to Pratt and Whitney standards of accuracy.

Send us your blue prints or specifications for an estimate on your requirements.
Ferry prices are low, but based upon the highest quality.

95% of the Foundrymen

of the middle west insist upon having Solvay Coke. They would resent being compelled to use any other kind. What better argument could possibly be offered as to the merit of this fuel?

Coke for foundry use must be *uniform*—in fact it were better to be uniformly poor than to *vary*. The highest efficiency in foundry operation cannot be reached except with standardized uniform materials.

Use the uniform fuel

SOLVAY COKE

"THE FUEL WITHOUT A FAULT"

FOR

FOUNDRY, FORGE AND FURNACE

for only by the use of such a fuel can you be positively certain to avoid the loss of time and money caused by poor runs, scrapped castings, bad heats and the hundreds of other troubles resulting from the use of a fuel that is not *dependable*.

As one feature only we may state that millions of dollars have been invested in acquiring large acreages of coal property so that the excellence and uniformity of the coals from which Solvay Coke is made might be always maintained.

There is a nearby oven ready to serve you as you would wish to be served.

The use of **Pulverized Coal** in **Open Hearth Furnaces** was not a success until the **RAYMOND SYSTEM** was used for grinding the coal.

With the Raymond System of Pulverizing and Air-Separation instead of screen separation you get any fineness of coal desired and the resultant product is so uniform that it burns immediately when introduced into the furnace. It is for this reason that the Raymond System has played such an important part in the development of Pulverized Coal as a Metallurgical Fuel.

A full description of this System will be mailed you upon request.

MAGNEFER is a hard-burned, dense, granular, basic refractory especially manufactured as a bottom material for open hearth and electric furnaces.

Comparative tests have shown that MAGNEFER is the most successful dolomitic base of this kind on the market.

MAGNEFER is synthetically prepared containing less than 5% silica and over 30% magnesia—will stand up longer than any other specially-treated dolomite and is extremely economical in use.

Build up your Furnace bottoms with MAGNEFER and increase your tonnage.

Largest Single Unit Reversing Type Motor

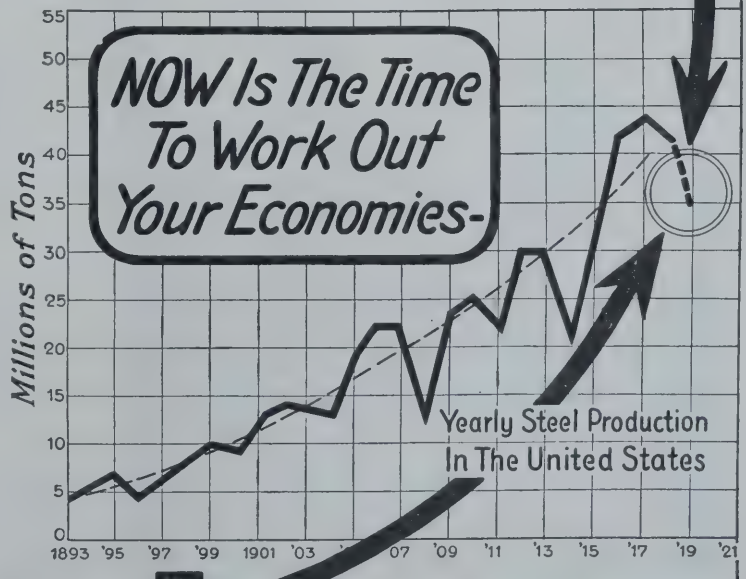
—Now Building In Our Shops

(When assembled, a view of this motor with engineering facts surrounding the installation, will be presented.)

Timely Improvements Under Way

Steel men are now undertaking improvements that will later afford greater economy of operation, increased capacity and a product of improved quality.

The course largely pursued by many, has been to determine what parts of the plant warrant improvement and to formulate a definite outline of the changes to be made with respect to first cost, the time needed to remodel and the advantages to be attained.



Those activities which have so far taken definite form, indicate that electric drive will be a big, if not the chief factor in effecting the needed economies.

Owing to the time required to build and install main motor units, it is only logical to see rehabilitation commence in this department.

Orders for two electric reversing mill drives to replace existing engines have recently been placed with this company. These mills are 40 and 44-inch respectively. In addition, the largest single reversing type motor is now building in our shops.

The broad experience of Westinghouse engineers is available at all times in the solution of power problems.

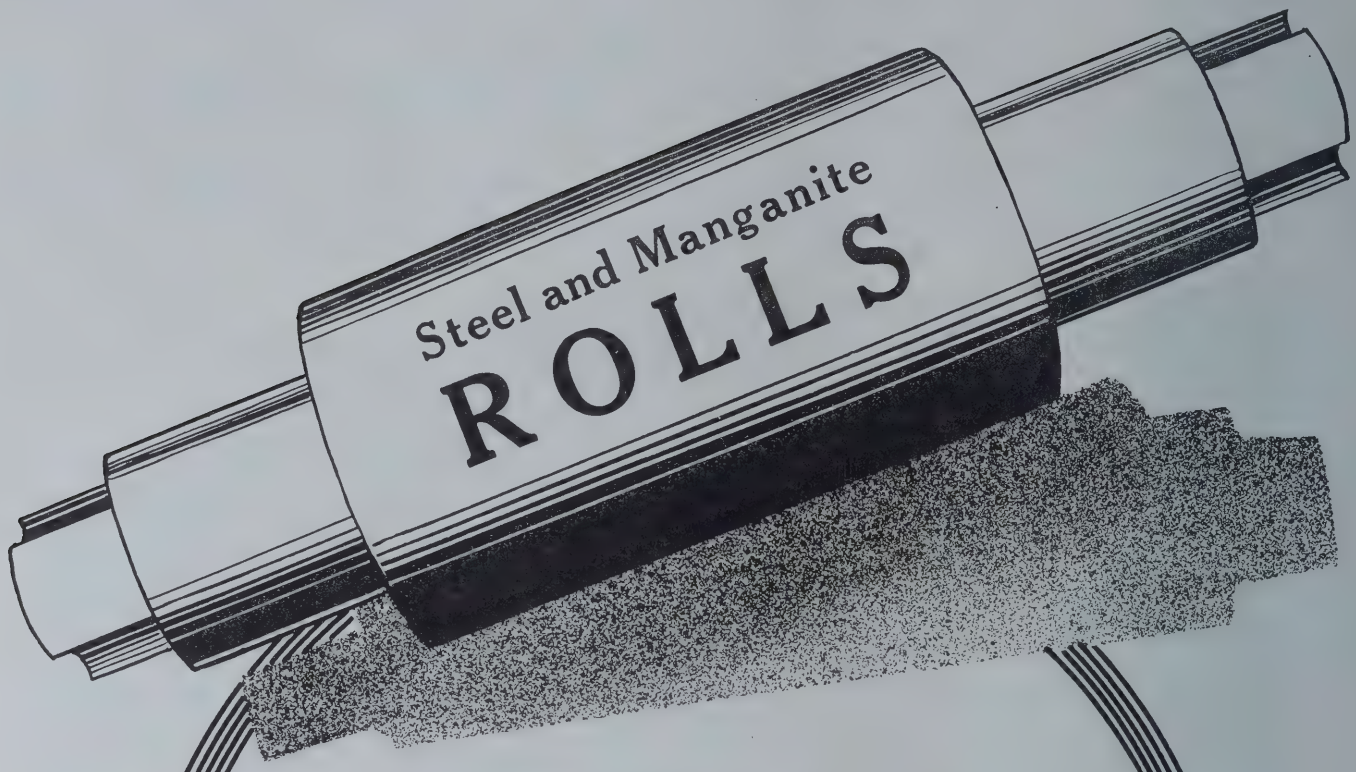
The high efficiency and dependability of G-E Synchronous Motors are relied upon in many industries today.

Three 212 h. p.-225 r.m.p. Synchronous Motor-driving Compressors in a railroad shop

88,000 h.p. of synchronous motors supplied in 1918 for air compressor drive

FOR a quarter century the General Electric Company has supplied synchronous motors designed for the particular work to be done. The first ones furnished are still in continuous service requiring maximum dependability.

For industrial drives these motors are furnished from 25 to 2000 h.p. capacity with speeds from 80 to 1800 r.p.m. and are designed to start any load met with in commercial practice without excessive current demands upon the power circuit.



The very high efficiency and dependability of these motors are due to their excellent design which is based on thorough testing of both raw materials and finished motors.

Our engineers will be pleased to supply additional information on these motors.

ROTARY SHEARS

MADE IN 7 SIZES

Cut all gauges of sheet and plate metal up to 1 inch thick in straight or irregular shapes and openings without cutting in from the side of sheet. Leaves square true edge that requires no finishing.
Used in building ships, boilers, tanks, cars and general plate and sheet metal work.

Patented June 3rd 1913

SAVE 50% TO 90%

Eliminates Oxy-acetylene Cutting and Plate Planing.

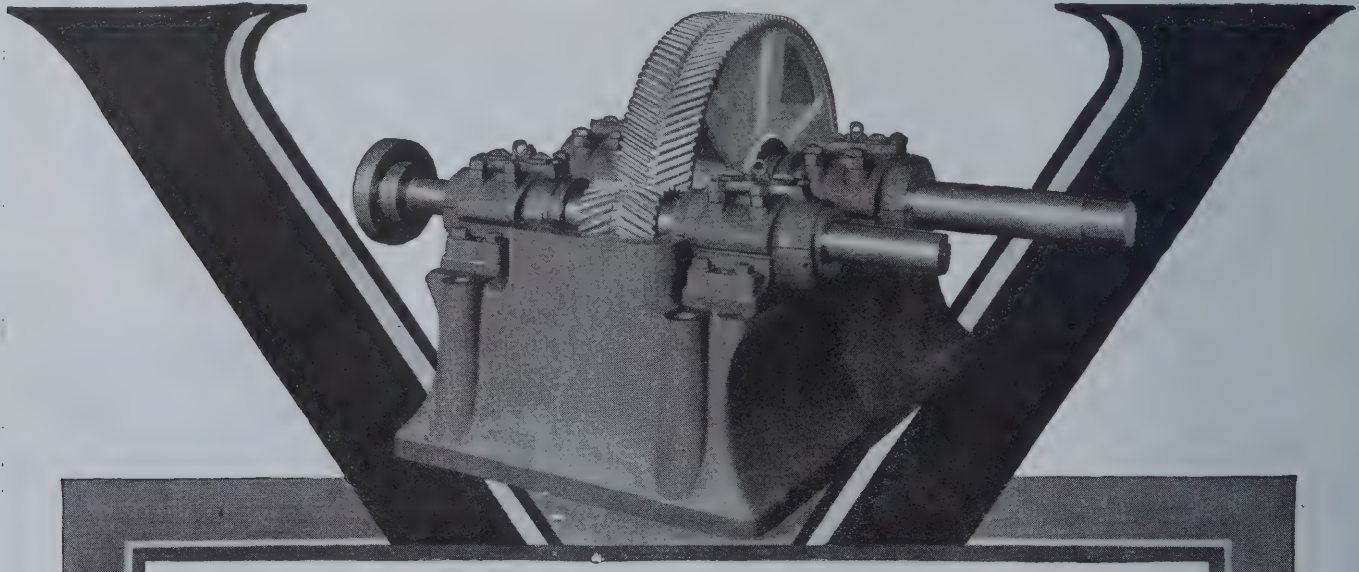
HARD SERVICE



AND NO REGRETS IS A REWARD OF BUYING THE BEST—ALLIS-CHALMERS CENTRIFUGAL PUMPS

Four bearing shells are all the repairs which have been ordered from us in two years for the 4-12" type "S" pumping units (two illustrated above) which were furnished the American Steel and Wire Company for their main mill supply. Allis-Chalmers conservatively selected and carefully tested pumping units can be depended on for the most reliable service.

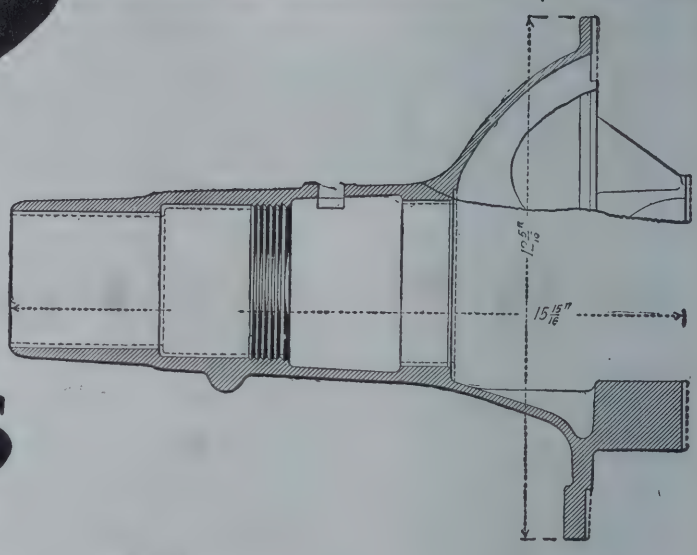
"UNITED" ROLLING MILL EQUIPMENT

"UNITED" PLATE SHEARS



We build a great variety of Plate Shears ranging in capacity from 1/4" to 2" in thickness and up to 192" in width. They are all arranged for motor drive and when necessary we attach our patented hold-down which securely holds the plates in position while being cut. A good shearing equipment is one of the most essential parts of a plate mill installation.

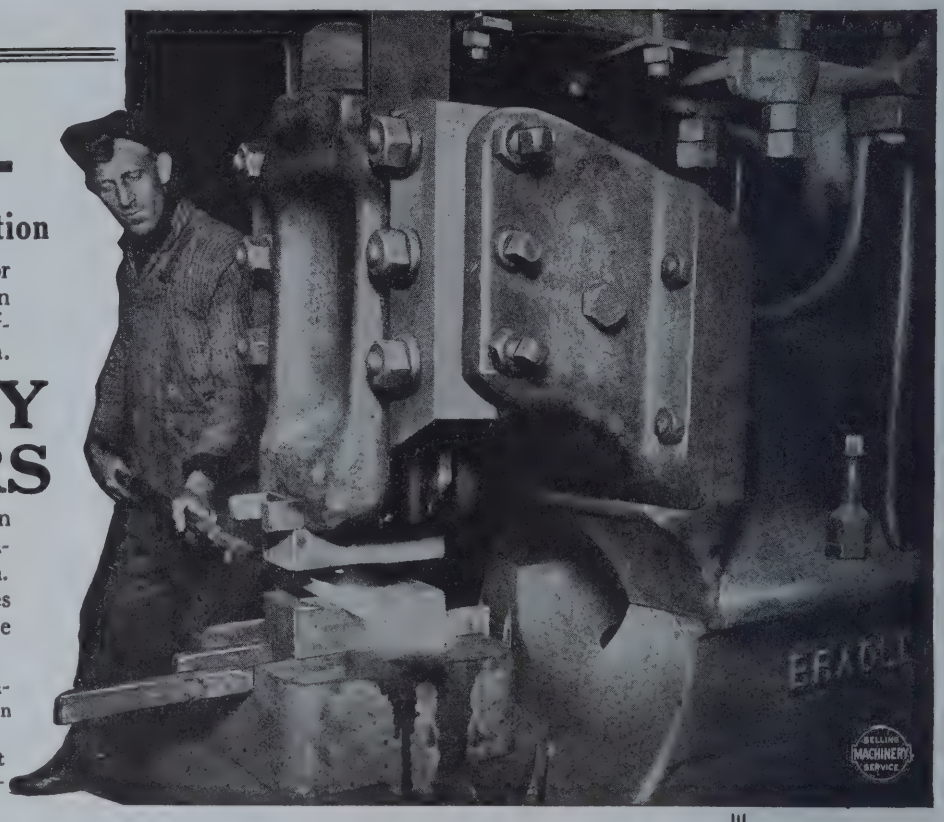
Speed—

Speed up your production



Quick response in starting or stopping saves much time in forging, and makes a big difference in the day's production.

BRADLEY HAMMERS

Slight pressure of the foot upon the treadle of a Bradley Hammer produces instant action. Varying this pressure regulates the force and rapidity of the blow.

Speed up your forging by installing Bradley Hammers. Made in the following types:

Cushioned Helve Hammers, Upright Strap Hammers, Upright Helve Hammers, Compact Hammers.

Thor

"HUNTER"

PNEUMATIC HAMMER

RIVET SETS

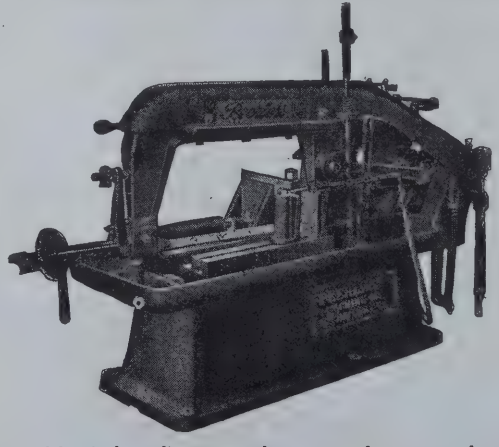
—AND—

CHISEL BLANKS

The shanks of our Rivet Sets are faced to a slight radius. This insures the piston coming in contact in line with the axis of set, increasing the effect of piston stroke on rivets, a particular advantage when hammer cylinders are worn, with a marked reduction in shank breakage.

Standard Chisel blanks are made from ¾ x 9" or ⅞ x 8" Octagon steel.

Standard sizes and types carried in stock.



We also manufacture a full line of metal cutting circular saw blades.

HUNTER SAW & MACHINE COMPANY

PITTSBURGH, PA.

Peerless HIGH SPEED

The Standard Metal Saw of TODAY

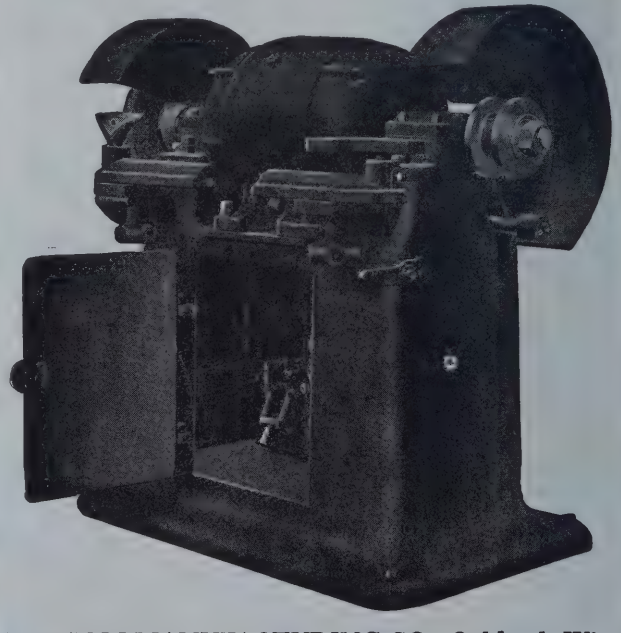
While labor is demanding more and more, manufacturers are demanding machines of greater output. The "Peerless" meets that demand. It is the standard metal saw of TODAY.

With its rapid cut and various time-saving features, it easily increases production from 50 to 100 per cent. With its automatic feed, straight line pull, positive blade clamp and general rigidity, it gets the maximum results of which a blade is capable and reduces breakage to a minimum.

Our Six-Speed Gear Box

(not shown in cut) further increases output and saves blades wherever soft steel or metals of varying degrees of hardness have to be cut. The "Peerless" is furnished either with or without this feature, also with or without motor.

A trial order at our risk and expense is convincing



Peerless Machine Company

1605 Racine Street **RACINE, WISCONSIN**

For REAL SERVICE use

Ransom Grinding Machines

The Ransom Patent Speed Controller is a safety device that prevents the possibility of overspeeding and yet enables the operator to maintain a constant periphery speed to the wheel as it wears smaller in diameter.

View of one of the Ryerson Structural Bays with High Speed Friction Saw in foreground.

Immediate Steel

Five Ryerson Steel-Service Plants maintain large and comprehensive stocks of the products of all the mills from the heaviest structural to the lightest bar, sheet or rivet.

Every product meets the standard specification of its class. Every product is stored in rooms or space especially provided to preserve its quality and finish.

High powered, accurate equipment is used and no effort is spared in making immediate shipments.

The unequalled Ryerson reputation, built up through over three-quarters of a century of business, protects every Ryerson customer.

The valve movement of Dean Bros. **Durable Duplex Steam Pump** is the most important improvement that has been made on the Duplex Pump for twenty-five years. *Send for Catalog 103.*

DEAN BROS. STEAM PUMP WORKS. **INDIANAPOLIS.**

Deming

Power Pumps for Industrial Service

Deming Triplex Power Pump Fig. 50 with tight and loose pulleys. Designed for any power drive.

Economical Boiler Feeding

A Deming User writes:

"A Deming Triplex Boiler Feed Pump Fig. 50 was installed in place of a steam driven Duplex Pump to feed two 150 H. P. boilers. *Aside from the saving in power* (about one-third that required for the steam driven pump) a great saving has been effected in the packing. The first set of packing lasted 18 months. In the steam pump using the same brand the packing of four plungers had to be replaced every three weeks."

Deming catalog and booklet "Feeding Boilers in Power Plants" sent on request.

THE DEMING CO., SALEM, O.

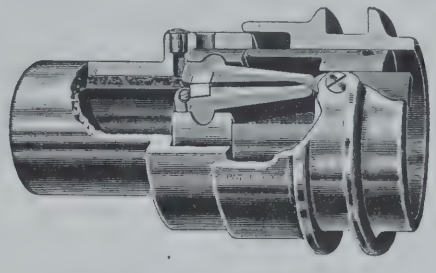
THE JOHNSON FRICTION CLUTCH



A Part of the New Mechanical Prodigy

Courtesy The Cone Automatic Machine Co., Windsor, Vt.

The Cone Automatic Machine Company makes the JOHNSON FRICTION CLUTCH a part of the equipment of the new Cone Automatic. The designers of this machine required a Clutch that was dependable—and the JOHNSON FRICTION CLUTCH installed at "R" has answered the need successfully in this case as it has in the hundreds of others The test of JOHNSON superiority is in service. Makers of the best machines ultimately fit JOHNSON FRICTION CLUTCHES to their machines and settle all doubt on clutch equipment forever.

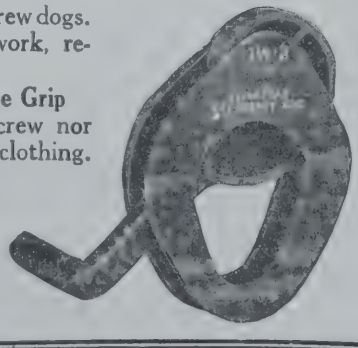
Efficiency Dogs and Dog Efficiency

Efficiency:—Save 95% of time consumed in using the antiquated set screw dogs.



Grip:—Swing the cam open, insert work, release, then:—

The Harder the Pull—The Tighter the Grip

Safety:—Absolutely safe. No set screw nor other projection to catch the clothing.

Quality:—Steel drop forgings, heavily case-hardened.

Witherow Steel Co., Pittsburgh, Pa.

See Index to Advertisements for Pages Containing Advertisements of Companies Listed Above

The new W & S Turret Lathe

has more power—is easier to operate

This new No. 6 Turret Lathe is stronger, has more power and a greater speed range. With its *double friction back gears* it has almost double the power of the single back geared machine. It has three spindle speeds instead of two for every shift of the belt.

The *heavy duty carriage* with six power cross feeds, together with the double friction back gears, make possible greater production on this new No. 6 than on any other machine of its size.

In addition to greater output, this No. 6 will finish parts in its size range which require strength and excess power just as well as the heavier and more expensive machines. This new No. 6 finishes at lower cost gear blanks, forgings and tough alloy steel parts.

2¼" Bar Capacity
20⅜" Maximum Swing

The Warner & Swasey Company

CLEVELAND, OHIO, U. S. A.

New York Office—Singer Bldg. **Boston Office**—Oliver Bldg. **Buffalo Office**—Iroquois Bldg.

The Reliability of the Cleveland Horizontal

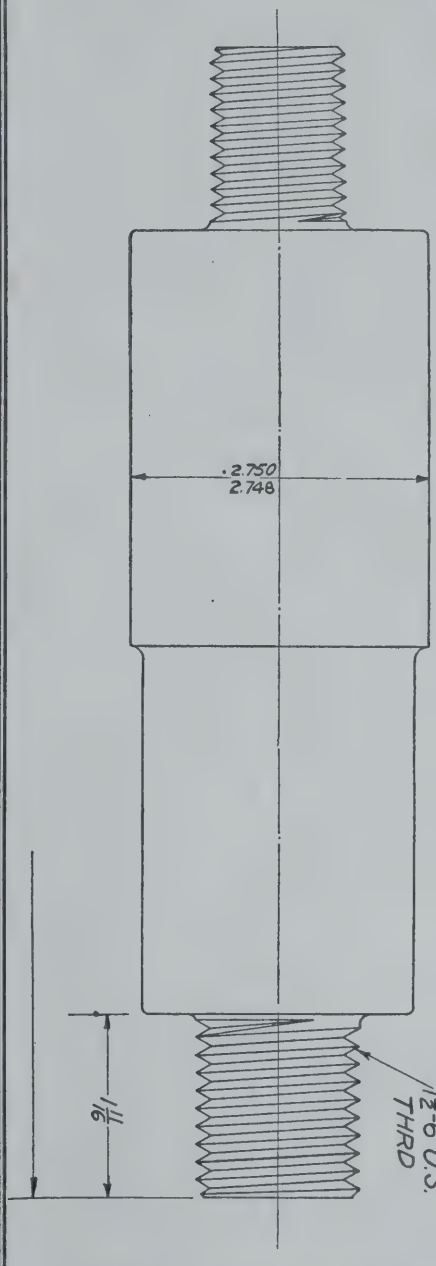
Boring
Drilling
Milling
Machines

is assured under any conditions that may arise.

This is proven by the excellent service these machines are giving in this country and abroad, both in government and private shops. Have you our illustrated catalog?

THE CLEVELAND MACHINE TOOL COMPANY

Established 1907



3215 Superior Ave.

CLEVELAND, OHIO, U. S. A.

New York Office: 1762 Woolworth Building
Detroit Office: 271 E. Jefferson Ave.
Chicago Office: 435 Stock Exchange Building
Pittsburgh Office: 203 Oliver Building

Mills Internal, External, Right or Left Hand, Straight or Tapered

The Smalley-General
Standard Thread Miller
No. 24

a single purpose machine especially designed for production work.

Below is a typical operation and time study of work performed by this machine.

Machine- Smalley - General Thread Miller No. 24.

Piece Milled- Main Idler Gear Pin.

Thread- Diameter 1½ in., length 1 11/16 in., 6 pitch U. S. Standard.

Material- Cold Rolled Steel.

Time Study 2 minutes and 30 seconds floor to floor. 55 seconds for milling thread.

SMALLEY-GENERAL COMPANY, INC.

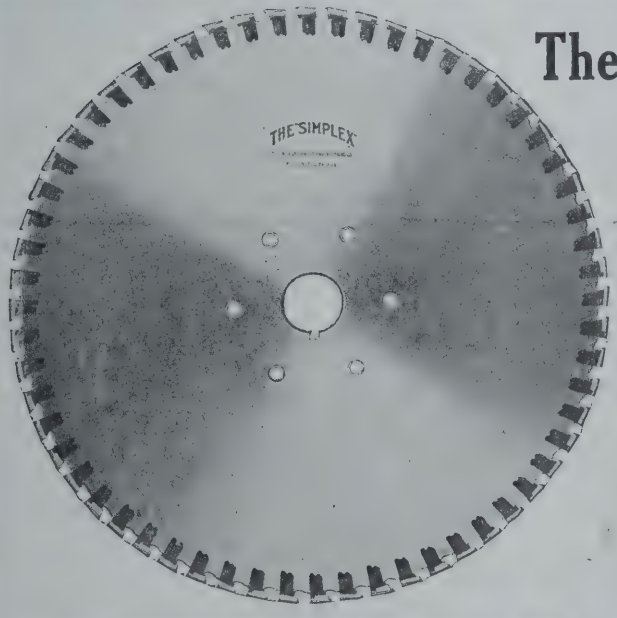
SIMONDS METAL SAWS



Quality, durability and cutting service are combined in Simonds Metal Cutting Saws. These saws are made by first-class mechanics, and are of quality steel from our own Steel Mills. Simonds Inserted Tooth or Solid Metal Saws are started right and finished right. You will find them in all parts of the world giving satisfaction on all kinds of metal cutting jobs.

Write for prices.

The SIMPLEX

The Inserted Tooth Saw that sets a New Goal for Sawing Efficiency—

Designed for cutting of the toughest metal. Every tooth an independent cutting tool in itself, which can be removed and sharpened separately. Blades made of superior quality crucible alloy steel, heat treated and finished by our own special process. Exceptionally strong and durable. Especially adapted for cutting rails, forgings, billets, blooms, bars, structural material, etc.

We also manufacture Slitting Saws, Milling Saws, Hot Saws, High Speed Friction Discs, Tube Saws, Pipe Cutters, Milling Cutters, Shear Blades, etc.

Faster, truer and more economical cutting——

Ordinarily, metal cutting is a slow, tedious and expensive job requiring frequent saw replacements.

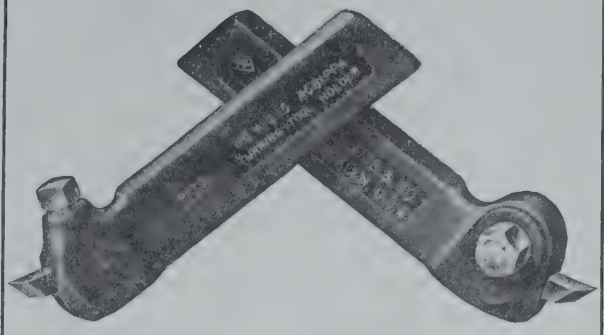
THE "RACINE"

HIGH SPEED

METAL CUTTING MACHINES

have placed metal cutting upon an entirely different and much more efficient basis. With these machines the saw blade touches the material only upon the cutting stroke, while upon the non-cutting stroke the blade is lifted entirely free from the metal. This prolongs the life of the saw blade almost 500% and greatly increases its cutting efficiency.

There is a "Racine" made for every metal cutting purpose.



Let us know your requirements.

CATALOG D.

USE "RACINE" H. S. TUNGSTEN BLADES STANDARD THE WORLD OVER

RACINE TOOL AND MACHINE COMPANY

RACINE, WIS., U. S. A.

Williams' "Agrippa" Turning-Tool Holders Set Screw Pattern

TO provide increased and abundant variety of selection in Williams' "Agrippa" line of Tool Holders, we offer this Set Screw Pattern of Turning-tools primarily for those who use Cutters made of steel which has been hammered or rolled with a greater variation in size than is common to usual mill practice. But for the majority of users who purchase Cutters of accurate size, we recommend the original "Agrippa" Turning-tool of Cam Pattern as being stronger, more reliable and more generally satisfactory than any other method of Cutter-fastening. Both patterns are illustrated above.

The Screws, made of a fine grade of Alloy Steel, are accurately machined and carefully heat-treated and hardened. They are unusually tough and strong and give the maximum efficiency obtainable from this type of Cutter-fastening.

Right and Left Hand Offset and Straight Shanks in stock at same prices as Cam Pattern of Corresponding size.

A copy of our Machinist's Tools Booklet will be sent on request.

Making Accuracy A Marketable Commodity

THERE'S a toolmaking shop in Detroit that refused to be stumped by any of the many problems our motor car builders present—the Michigan Tool Company.

This concern is fully equipped for any job—which means Dumore Grinders are there to do their bit.

In building jigs, standard bushings are used, the outer diameters running in an ascending series of sizes and calling for an arbitrary "constant" for the press-fit.

For grinding of this kind the Dumore is the ideal tool—high speed, dynamically balanced, non-vibrating, easy to move out of the way to permit the various holes to be indicated.

Write for information.

Operate your plant on the
AMERICAN plan---
save *time, material* and *labor.*

American Grinding Pans

will better enable you to prepare your refractory material for the patching or lining of furnaces and ladles.

They are very efficient in grinding ganister, limestone, used-fire brick or other refractory material or for mixing fire clay.

Write for our latest Bulletin.

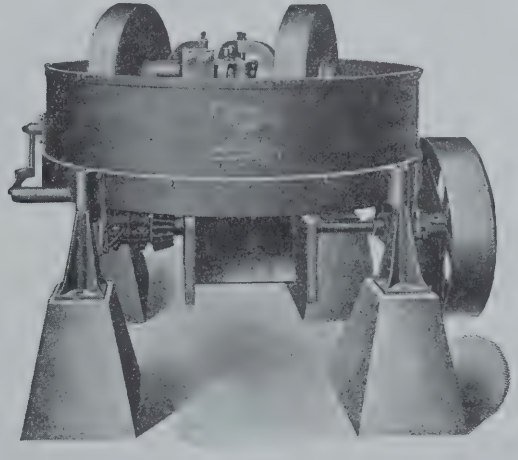
American Clay Machinery Company
BUCYRUS, OHIO

HOEVEL SANDBLAST MACHINES
Patented

Dustless Sandblast Rooms, Rotary Table, Revolving Barrel Sandblast Machines, Hose Sandblast and all other Sandblast Equipment.

Hoevel Manufacturing Corporation 152 Ogden Avenue
Controlled by L. O. Koven & Bro. Jersey City, N. J.
Cleveland Office: 503 American Trust Bldg.

PORTAGE SANDS
HIGHEST GRADE
For All Purposes
THE PORTAGE SILICA CO
Youngstown Ohio



"AMERICAN"
Sand Blast Equipment

Rotary Tables, Rooms, Cabinets, and all accessories. A developed line of standardized equipment warranted to give satisfaction.

AMERICAN FOUNDRY EQUIPMENT CO.
52 VANDER BILT AVE. NEW YORK

The Simpson Intensive Foundry Mixer

Economical and Efficient for all kinds of Foundry Sand Mixtures

Automatic Discharge. Saves Labor and Materials.

Produces a thorough mixture, gives large capacity with small cost for maintenance and operation.

Its success demonstrated in a great many of the best known plants of the country.

Edwards Steel Lockers

Built for Strength and Durability

Require the least number of parts to complete a unit, reducing the labor of erection to a minimum. Can be erected by ordinary workmen, the only tools needed—a wrench and screw driver. Will gladly furnish sketches showing arrangement of lockers suitable for your requirements. Send specifications for estimate.

15-Ton Whiting Malleable Furnace recently furnished Great Lakes Malleable Co., Milwaukee, Wis. Customer reports installation is giving "exceptionally fine service."

FOUNDRIES EQUIPPED COMPLETE
CRANES OF ALL TYPES

WHITING MALLEABLE FURNACE

For Good Malleables

Malleable iron is the ideal material where strength, freedom from excessive weight and ability to withstand shock and vibration are required. Its rapid adoption by the automotive and implement industries is creating a new field for the maker of malleable castings.

It is no secret to make good castings with a Whiting Malleable Furnace and annealing oven. We furnish all equipment and instruct customer as to operation.

Full information on request.

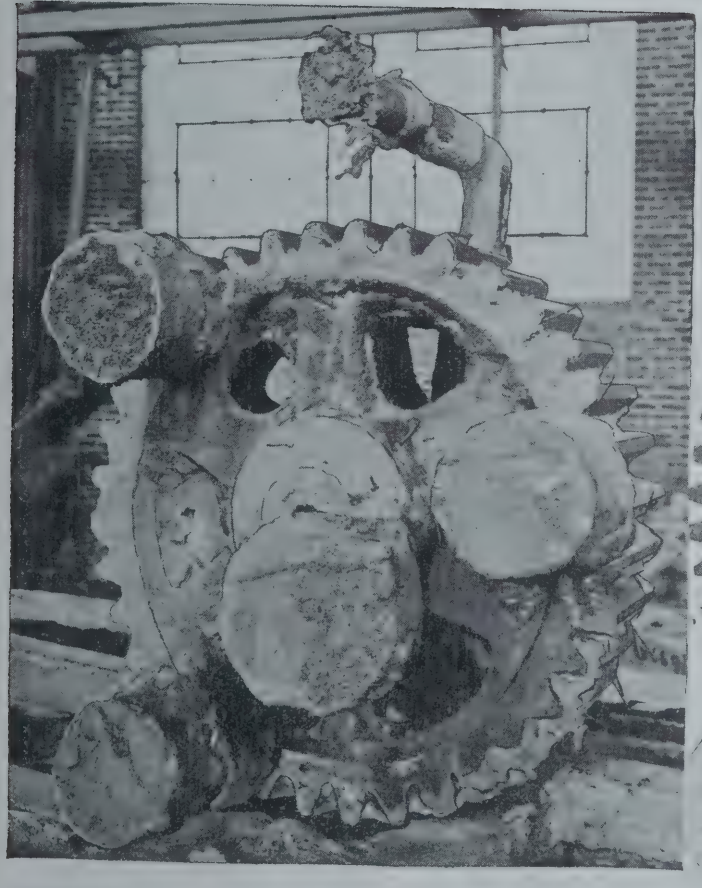
Steel Castings

VULCAN Characteristics—

Castings true to pattern.

Risers ground off *even* with face of casting. Smooth, clear and clean without "cold shot" or blow holes.

When you order VULCAN Steel Castings, you can specify *half* the usual "oversize" with a two-fold saving:—First, less weight to pay for in the casting; second, not so much metal to be removed by expensive machine work.



VULCAN Steel Castings are the product of scientific foundry practice.

Prompt deliveries.

VULCAN IRON WORKS

1739 Main Street
Wilkes-Barre, Pa.

The same casting just out of the mould and cleaned up ready to weigh.

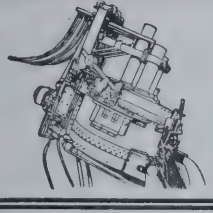
ELECTRIC FURNACE STEEL CASTINGS

Do you wish castings of uniform soundness, clean, smooth and true to pattern?



We are equipped with every modern facility for the production of high class steel castings under Lloyd's Register of Shipping, American Bureau of Shipping, Society of Automobile Engineers, and for various commercial, chemical and physical specifications.

We shall be pleased to take care of your requirements and assure you of most excellent quality and service.

Although we make electric furnace steel castings for all purposes, we specialize on castings for *shipbuilders, motor trucks, tractors, saw mill machinery, hydraulic machinery, mining machinery,* etc.

Our steel foundry was established in 1912, and our continuous healthy growth is proof of our many satisfactory business connections.

Every Gray Iron Foundry Needs This Book!

METALLURGY OF CAST IRON
By THOMAS D. WEST

The standard American work on gray iron foundry practice. It goes thoroughly into every phase of the subject—coke, pig iron, mixing by analysis, cupola operation, tests, etc., etc.

It presents many new subjects, principles and ideas—none, however, that have not been tried satisfactorily by the author. It is void of confusing minutiae and is clearly and forcibly written.

627 PAGES, ILLUSTRATED—PRICE $3.00, POSTPAID

Welds that can be easily machined

Purity is the first essential of welding wire. Welding wire containing sulphur, manganese, silicon, slag or oxides will not flow evenly or produce welds which are free from pinholes or soft, hard, or brittle spots.

Cleveland Steel Supply Co. Welding Wire is entirely free from foreign substances. It has a low melting point, a high tensile strength and is consistently uniform.

A trial will convince you of its superior qualities.

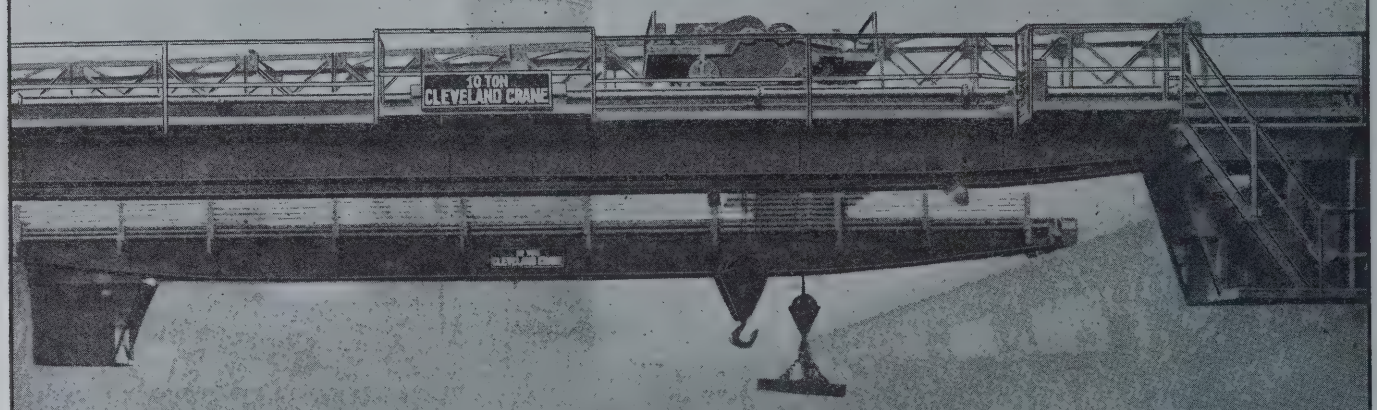
LOCOMOTIVE CRANES
CLAM SHELL BUCKETS - SHIPBUILDING CRANES
CAR DUMPERS PILE DRIVERS
THE McMYLER INTERSTATE CO.
CLEVELAND OHIO

This is also a McMYLER INTERSTATE from Crane Headquarters



We cannot repeat too often the fact that we build MORE than simply locomotive cranes. This is the one big thought to keep clearly in mind through this critical reconstruction period, when the only *certain* fact is that the man with the best equipment will make the most profits from reawakened general industry. WE ARE CRANE HEADQUARTERS—be it a problem of equipping a freight terminal, a ship yard or securing a many-in-one crane (such as Type "J") for general contracting purposes. The Crane illustrated handles a 5-yard bucket at 100 ft. radius. Our facilities and our veteran Engineering Department are adequate to any material-handling problem.

"The Most Rugged Crane Built"

CHESAPEAKE CRANES

Any Capacity-Prompt Shipments

Chesapeake Iron Works
Baltimore, Md.

An Interesting "Alliance" Crane

Our "Hobby" is Large and Special Types of Cranes

The illustration shows one of six large, electrically operated traveling tower jib cranes built and erected by us in the ship yard of the Maryland Steel Company, Sparrows Point, Md.

Two of these cranes have a capacity of 15 tons each; the capacity of each of the other four is 12½ tons. The height of cranes, from the track on which they travel, to the top of the towers, is 125 ft. Each crane has a working radius of 60 ft. and is operated by an electric motor on 220-volt direct current. The bases of the cranes are so constructed that a locomotive can readily pass through. Each crane is carried on eight large track wheels mounted in equalizing trucks, and is provided with a weatherproof cab for the operator.

"Alliance" Progressive Engineering Developments BEGIN where others leave off.

THE ALLIANCE MACHINE COMPANY

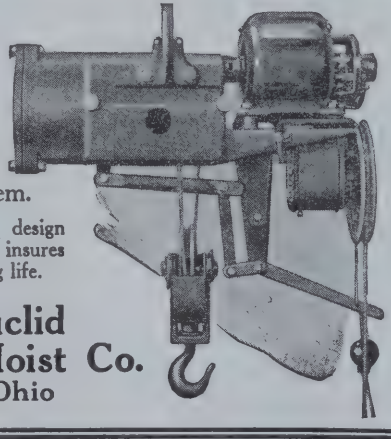
ALLIANCE, OHIO

PITTSBURGH BIRMINGHAM

Say you saw it in THE IRON TRADE REVIEW

ERIE CRANES

MAY NOW BE EQUIPPED WITH



HYATT ROLLER BEARINGS

The first ERIE CRANE, equipped with roller bearings, was built nearly two years ago. It has been subjected to every test, and promises to give years of uninterrupted service. Due to the reduced friction losses, loads can be handled more quickly and spotted more accurately. The power required for traveling is reduced 48.5% over a bronze bushed crane, and more than this over an ordinary crane with babbitted bearings. The increased cost is negligible, compared to the advantages gained.

We are prepared to build traveling cranes up to 30 tons capacity, with either Hyatt Roller Bearings or all bronze bushings.

ERIE STEEL CONSTRUCTION CO.
ERIE, PENNA.

EUCLID HOISTS

is one way of solving the labor problem.

Their simple, compact design and rugged strength insures efficient service and long life.

The Euclid Crane & Hoist Co.

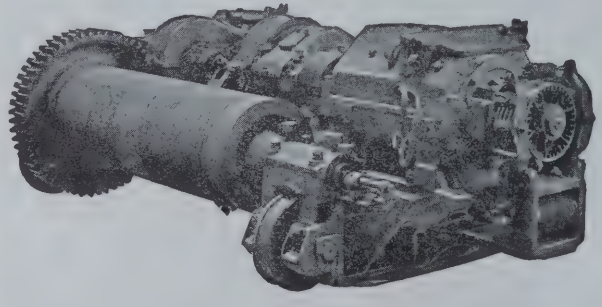
LOCOMOTIVE CRANES TIMBER & STEEL DERRICKS



LET US SOLVE YOUR MATERIAL HANDLING PROBLEMS

CRANES

for all purposes

Electric and Hand Power

Case Standard Cranes are the result of thoroughly tested ideas secured during many years from the best designing and operating engineers. They are manufactured under the most favorable conditions in a plant recently equipped at large expense for this particular purpose. They represent the greatest value for price charged.

The Case Crane & Engineering Co.

Electric Overhead Traveling Cranes

COLUMBUS, OHIO

"Heavy Duty"

Portable Chain Hoists for "heavy duty" must be dependable. Box Double-screw Type Chain Hoists do the work and stand the treatment because they are a little heavier in weight than other standard makes of the same capacity. The extra weight is in the place where it will do the most good, the working parts and the suspension frame.

It has only three working parts in the main mechanism, a hardened steel shaft and two worm wheels operated by it.

In industries where hard usage is necessary, it stands the test.

Box Double-screw Type Chain Hoists are the best in quality and are sold at the right price. They are worth investigation. Write for further details.

VENTILATING FANS AND SYSTEMS
BUCKEYE

Always—
Clean Pure Air

A plant which is provided with adequate ventilation is a plant whose men are wide awake, alert and energetic—a real live working force.

Let us help you realize the benefits to be gained from proper ventilation. Talk with our experts upon this subject. Their advice and consultation is free.

Buckeye Ventilating Systems handle efficiently, every kind of an air problem.

They remove dead air or fumes, collect dust from polishing and buffing wheels, sand-blast machines, tumbling barrels, etc.

Write for our Catalog.

ReMANUFACTURED MACHINE TOOLS
-(ORIGINATED BY US)-

The Pledge Behind Every Machine

Hill, Clarke & Co. of Chicago owes its growth to the confidence of users of Remanufactured Machine Tools in the Remanufacturing process.

Once any sort of "re-made" or "re-built" machine was object of criticism. To overcome the objections to re-built tools, a process as thorough as that employed in making new tools was developed.

We named it the Remanufacturing process to distinguish it from any method which assured less than a machine of "new" value, as our process did.

Then to show our own confidence in Remanufactured tools, we accorded them as broad and unconditional a guarantee as was ever given to a new machine.

LATHES:—

14 x 5 Seneca Falls lathe.
14 x 6 Seneca Falls lathe.
14 x 6 Sebastian lathe.
15 x 6 Monarch lathe.
15 x 6 Springfield lathe, Q.C.G.
16 x 6 Reed lathe.
20 x 8 Prentiss geared head lathe S.P.D.
21 x 36 x 16 Le Blond gap lathe.
18 x 8 Superior Q.C.G. lathe (new).

MILLERS:—

U. S. hand miller (new).
No. 1½ American plain miller (new).
No. 1½ Brown & Sharpe Universal Miller.
No. 2 Becker Universal Miller.
Brown & Sharpe manufacturing miller.
Lees-Bradner thread miller.
No. 25 Becker plain miller.
No. 13 Garvin Plain Miller.
No. 3½ Fox Plain Miller.
10 x 28 Bristol vertical miller.

GRINDERS:—

No. 2 Brown & Sharpe surface grinder.
No. 3 Brown & Sharpe universal grinder.
Yankee Twist Drill Grinder.
No. 1½ Cincinnati universal tool grinder.
Garner No. 1 Disc Grinder.
Besley No. 14 Disc Grinder.
12 x 36 Bridgeport plain grinder.
10 x 52 Landis cylindrical grinder.
14 x 50 Norton cylindrical grinder.

SHAPERS:—

24" Fellow gear shaper.
24" Gould & Eberhard b. g. shaper.
28" Smith & Mills shaper, planer type.
32" Smith & Mills b. g. spd. shaper.

PRESSES:—

Single spindle Henry & Wright drill presses.
2-Spindle Henry & Wright drill presses.
20" Excelsior b. g. new drill press.
26" Barnes G. H. sliding head drill press.
36" Fitchburg B.G. sliding head drill press.
36" Snyder B.G., sliding head drill press.
Henry Rueson power press 1½" stroke.
Zeh & Hahnemann reducing presses 14" stroke (horizontal).

PLANERS:—

24" Fay & Egan pony-wood planer.
30 x 30 x 10 Powell 2 heads on rail, equipped for motor drive (new) planer.
36 x 36 x 14 Woodward & Powell single head planer.
36 x 36 x 12 Niles, planer, 2 heads.

BORING MILLS:—

1—60" Niles 2 head, s.p.d. vertical boring mill.
90" Old Type boring mill.
No. 26 Epson Lucas horizontal boring mill 4" bar.

MISCELLANEOUS

1—5 Ton United Foundry Crane.
Little Giant Steam shovel.
2000-lb. Chambersberg steam hammer.
8" Shuhart & Schutte gear hobber.
No. 2 Norton Keyseater.
Williams Shreader.
Farrel Crusher.
2" Saunders pipe machine.
2-spindle Pratt & Whitney profiler.
Garvin single spindle profiler.
Blaisdell vacuum pump, D.C. motor.
1—Newboldt circular sheer, D.C. motor.
No. 5B United Engineering shear.
Grant Riveter $\frac{3}{16}$".
Racine Hack saws.
Morton traveling head slider.
5 Langlier swaging machines.
Garvin automatic tapping machine.
1½" 4-headed Webster and Perks bolt threader.
No. 2 Garvin Screw Machine wire feed auto. collets friction countershaft.

VERY LOW PRICES

Engine Lathes

18" x 7' Chard Semi Q. C. G. Lathes.
22" x 8' Hamilton Semi Q. C. G. Lathes.
22" x 10' Hamilton Semi Q. C. G Lathes.
22" x 10' Davis Q. C. G. Lathes.
21" x 8' LeBlond Q. C. G. Manufacturers Type.

Turret Lathes

No. 2 Warner & Swasey.
21"-25" x 8' x 10' LeBlond Heavy Duty Universal Lathes.
21"-24" Gisholt Lathes.
22"-26" Libby Lathes.
24" Steinle Full Swing Side Carriage Lathes.

Air Hoists

Pneumatic Air Hoists, Air Balanced Type, 4" and 6" with 4' Lift.

Drilling Machinery

Allen, Henry & Wright, Natco, Pratt & Whitney 2 to 16 Spindles.

Grinders

B. & S. Universal Grinders.
Cutter & Reamer Grinders of standard makes.
No. 1 and No. 2 Sellers Tool & Shaping Grinders.
Taylor & Penn Wet Tool Grinders.

Milling Machines

No. 2, No. 3 and No. 5 Plain Cincinnati Milling Machines.
No. 5 Garvin Milling Machines.
No. 2 Brown & Sharpe Milling Machines.
30" Niles Slab Milling Machine.
50" Ingersoll Slab Milling Machines.

Presses

415 Ton Hydraulic Presses.

Mill Supplies

Line Shafting, Hangers, Steel & Cast Iron Split Pulleys.

Cold Saws (Inserted Teeth) Hunter & Disston Makes
40-in. to 48-in. diameter.

35000 TON
STEEL (NEW) PRODUCTS
from
Government and other Opportune Purchases

WIRE

16,000 Ton Smooth Wire, Galvanized, Bright Annealed, No. 13 Gauge to No. 1 Gauge.
10,000 Ton Barbed Wire, 4 pt. painted and black.

SHEET STEEL

Our total purchases amount to 6000 TONS. From 12-22 gauge and sizes up to 30 x 120.
Still available:
100 Ton of 18 gauge I. P. C. R. 30 x 110.
100 Ton of 14 gauge I. P. C. R. 30 x 106.

STEEL PLATES

20 Ton 9½ x 113 x $\frac{5}{16}$".
15 Ton 16 x 96 x $\frac{5}{16}$".

CORRUGATED SHEET STEEL—New

6000 squares 22 gauge corrugated sheets 27½ x 120" and 27½ x 84", painted red two sides.
500 squares 12 gauge, 5" corrugations (four form a circle) 38 x 84" curved steel sheets.
100 squares 12 gauge 5" corrugations, 38 x 84" flat steel sheets.

CORRUGATED STEEL PLATES

200 Ton new corrugated Steel Plates manufactured for use of a large car company for corrugated car ends.

STORAGE TANKS

Vertical

50—20 ft. diam., 12 ft. high caulked inside and outside with top, side and bottom openings. Made mostly of $\frac{5}{16}$" Plate.
Cap. about 30,000 Gal. Have conical shaped tops. Will be shipped knocked down with all parts marked for re-erection.

Horizontal

Diam.	Length	Cap.
6 ft.	24 ft.	5,500 Gal.
8 ft.	20 ft.	8,500 Gal.
7 ft.	36 ft.	10,500 Gal.
8 ft.	30 ft.	11,500 Gal.

These Tanks are of heavy construction, being made mostly of ½ in. plate and were used only a limited time for war purposes.

Machine Tools, Electrical and Power Equipment

We have $500,000 above equipment at our Chicago Works.
Also Locomotives, Steam Shovels, Structural Machinery, etc.

We can quote you on your needs

MACHINE TOOLS

We offer for sale the following machine tools which we have in our warehouse for immediate shipment. These are modern machines in excellent condition, upon which we are able to quote attractive prices.

1—No. 5 geared Toledo punch press. Like new.
6—No. 200 Heald Ring Grinders.
1—No. 6 Wood tilted turret lathe.
1—No. 4 Wood tilted turret lathe.
1—30x10 Harrington engine lathe.
1—22x16 Gleason engine lathe.
1—40x12 Gleason engine lathe.
1—No. 5 Becker vertical miller.
1—No. 1½ Rockford plain miller.
1—3′ Dresses radial drill, cone driven.
1—6′ Bickford radial drill, cone driven.
1—40″ sliding head drill press.
1—22″ sliding head drill press.
1—28″ Smith & Mills triple geared shaper.
1—No. 60 Heald cylinder grinder.
2—12x36 Modern plain grinders.
5—No. 51 Acme 4-spindle automatic screw machines.
1—36″ Niles boring mill, 2 swivel heads.
1—72″ Bullard boring mill, 2 swivel heads.
1—36″ Fellows gear shaper for spur and internal gears.
1—36x36x12 Wilson planer, new.
1—Detroit Centerless Cylindrical grinder, like new.

We will be pleased to send you full description of any of these machines upon receipt of your advice.

Exceptional Power Plant Offering

Due to electrifying six plants of The City Ice Delivery Co., Cleveland, Ohio, we have purchased and offer for immediate sale—Boilers, Engines, Pumps and other machinery as follows:

BOILERS

Return Tubular

6—72x18 Hand fired 85 lbs. steam, 150 H.P.

Water Tube

2—133 H.P. B. & W. Hand Fired, 100 lbs. steam.
1—275 H.P. Sterling, 150 lbs. steam.
1—400 H.P. Sterling high pressure, 160 lbs. steam.

CORLISS ENGINES

Complete with balance wheels and outboard bearings, no belt wheel.

1—18x42 Right-hand Atlas.
1—22x42 Left-hand Atlas.
1—22x48 Featherstone left-hand.
1—22x42 Hamilton right-hand.
1—24x48 Lane & Bodley left-hand belt drive.

PUMPS

All Duplex and in fine condition.

1—4½x5x8
3—5x3x6
2—5¼x3½x5
1—5½x3½x5
3—6x4x6
1—6x5¾x6
1—6x4x7
1—6x4x8
6—7x4½x8
1—8x5x10
1—8x7x12
2—10x8½x12
1—12x8x12
1—12x8½x12
1—8x10x12 Vacuum pump

AIR COMPRESSORS

1—Westinghouse 11x11x11.
1—Weir 10x9x14.

VERTICAL ENGINES

1—6x6
1—6x8
1—7x7
3—8x8
1—8x10 double
1—8x12 side crank horizontal

CONTRACT WORK!!!

Start paving the way to bigger business by letting the Fill-In and Contract Work Department of THE IRON TRADE REVIEW serve you.

The readers of THE IRON TRADE REVIEW are just the men you want to interest—the men of big affairs in the iron, steel, foundry, machinery and metal-working industries; the men upon whom falls the responsibility of direction and management.

Why not interest them now?

Say you saw it in THE IRON TRADE REVIEW

Oxweld

Profitable Specialties in the Boiler Shop

THE entire weight of this great sulphite tank, with 16-inch concrete interlining, rolls on two 6-inch by 4-inch steel bands, which are oxwelded together in four sections.

The range of specialties your shop can make is limited only by your ingenuity if you give your men Oxweld Equipment.

Write for Bulletin Series 1. You'll see practical examples of oxwelding, and the Injector Blowpipe that does it.

OXWELD ACETYLENE COMPANY

NEWARK, N. J. CHICAGO LOS ANGELES

World's Largest Maker of Equipment for Oxwelding and Cutting Metals

197

A. C. STARTING SWITCH
TYPE ZB

FOR STARTING SMALL INDUCTION MOTORS

WHAT THEY SAY

A large manufacturer of automobile parts says:

"We take pleasure in stating that the ZB Motor Starter has proven very satisfactory in every respect, performing all the duties claimed for it by the manufacturer.

Believing that this type of starter will pay for itself in a very short time, have recommended that these be installed on all of our motors for 5 HP and under."

WHAT WE CLAIM

Remote control.
Overload protection.
Lost phase protection.
Safety from shocks or burns.
Inverse time element overload without dash pots.
No laminated parts.
